### **Brewery Problem**

#### Brewery brews ale and beer.

- Production limited by supply of corn, hops and barley malt
- Recipes for ale and beer require different amounts of resources

	Corn (kg)	Hops (kg)	Malt (kg)	Profit (€)
ale (barrel)	5	4	35	13
beer (barrel)	15	4	20	23
supply	480	160	1190	

EADS II Harald Räcke	12

## **Brewery Problem**

#### Linear Program

- Introduce variables a and b that define how much ale and beer to produce.
- Choose the variables in such a way that the objective function (profit) is maximized.
- Make sure that no constraints (due to limited supply) are violated.

max	13a	+	23 <i>b</i>	
s.t.	5a	+	15b	$\leq 480$
	4 <i>a</i>	+	4b	$\leq 160$
	35a	+	20 <i>b</i>	$\leq 1190$
			a,b	≥ 0

## Standard Form LPs

#### LP in standard form:

- input: numbers  $a_{ij}$ ,  $c_j$ ,  $b_i$
- output: numbers  $x_j$
- n =#decision variables, m = #constraints
- maximize linear objective function subject to linear (in)equalities

#### EADS II Harald Räcke

14

3 Introduction to Linear Programming

## **Standard Form LPs**

#### **Original LP**

max	13a	+	23 <i>b</i>	
s.t.	5a	+	15b	$\leq 480$
	4a	+	4b	$\leq 160$
	35a	+	20b	$\leq 1190$
			a,b	$\geq 0$

#### **Standard Form**

Add a slack variable to every constraint.

ĺ	max	13a	+	23 <i>b</i>								
	s.t.	5 <i>a</i>	+	15b	+	$S_C$					= 480	
		4 <i>a</i>	+	4b			+	$s_h$			= 160	
		35a	+	20 <i>b</i>					+	$s_m$	= 1190	
		а	,	b	,	$S_C$	,	$s_h$	,	$S_m$	≥ 0	J
EADS Haral	ll d Räcke			3 Introdu	iction	to Linea	ar Prog	Irammir	ıg			

## Standard Form LPs

It is easy to transform variants of LPs into (any) standard form:

less or equal to equality:

$$a - 3b + 5c \le 12 \implies a - 3b + 5c + s = 12$$
  
 $s \ge 0$ 

greater or equal to equality:

 $a - 3b + 5c \ge 12 \implies a - 3b + 5c - s = 12$  $s \ge 0$ 

min to max:

$$\min a - 3b + 5c \implies \max -a + 3b - 5c$$

16

## **Standard Form LPs**

There are different standard forms:

	tandard	-							
max	$c^T x$				min	$c^T x$			
s.t	. Ax	=	b		s.t.	Ax	=	b	
	x	$\geq$	0			x	$\geq$	0	
ma	standa kimizatio		rm			standa mizatio		rm	
max	$c^T x$			) (	min	$c^T x$			
s.t	. Ax	$\leq$	b		s.t.	Ax	$\geq$	b	
	x	$\geq$	0			x	$\geq$	0	
EADS II Harald Räcke		3	Intro	duction to Linear Progra	mming				17

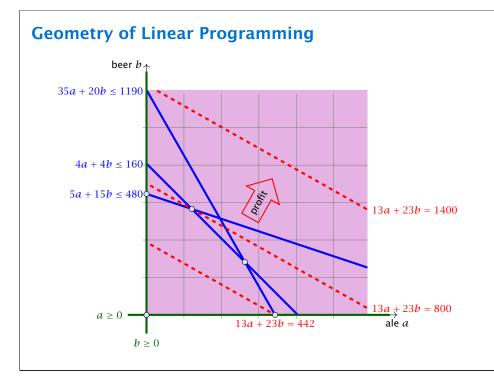

## Standard Form LPs It is easy to transform variants of LPs into (any) standard form: • equality to less or equal: $a - 3b + 5c = 12 \implies \begin{array}{c} a - 3b + 5c \leq 12 \\ -a + 3b - 5c \leq -12 \end{array}$ • equality to greater or equal: $a - 3b + 5c = 12 \implies \begin{array}{c} a - 3b + 5c \geq 12 \\ -a + 3b - 5c \geq -12 \end{array}$ • unrestricted to nonnegative: x unrestricted to nonnegative: x unrestricted $\implies x = x^+ - x^-, x^+ \geq 0, x^- \geq 0$

## **Standard Form LPs**

#### **Observations:**

- a linear program does not contain  $x^2$ ,  $\cos(x)$ , etc.
- transformations between standard forms can be done efficiently and only change the size of the LP by a small constant factor
- for the standard minimization or maximization LPs we could include the nonnegativity constraints into the set of ordinary constraints; this is of course not possible for the standard form

## **Fundamental Questions**

#### **Definition 1 (Linear Programming Problem (LP))**

Let  $A \in \mathbb{Q}^{m \times n}$ ,  $b \in \mathbb{Q}^m$ ,  $c \in \mathbb{Q}^n$ ,  $\alpha \in \mathbb{Q}$ . Does there exist  $x \in \mathbb{Q}^n$  s.t. Ax = b,  $x \ge 0$ ,  $c^T x \ge \alpha$ ?

#### Questions:

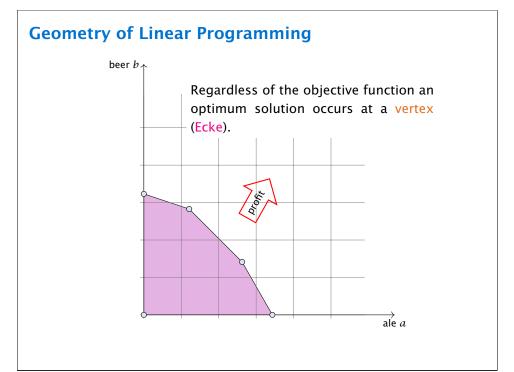

- ► Is LP in NP?
- Is LP in co-NP?
- Is LP in P?

#### Input size:

5

*n* number of variables, *m* constraints, *L* number of bits to encode the input

EADS II Harald Räcke	3 Introduction to Linear Programming

## Definitions

Let for a Linear Program in standard form $P = \{x \mid Ax = b, x \ge 0\}.$
P is called the feasible region (Lösungsraum) of the LP.
• A point $x \in P$ is called a feasible point (gültige Lösung).
If P ≠ Ø then the LP is called feasible (erfüllbar). Otherwise, it is called infeasible (unerfüllbar).
<ul> <li>An LP is bounded (beschränkt) if it is feasible and</li> <li>c<sup>T</sup>x &lt; ∞ for all x ∈ P (for maximization problems)</li> <li>c<sup>T</sup>x &gt; -∞ for all x ∈ P (for minimization problems)</li> </ul>

	3 Introduction to Linear Programming	
🛛 🕒 🖯 Harald Räcke		24

#### **Definition 3**

A set  $X \subseteq \mathbb{R}^n$  is called

- a linear subspace if it is closed under linear combinations.
- an affine subspace if it is closed under affine combinations.
- convex if it is closed under convex combinations.
- a convex cone if it is closed under conic combinations.

Note that an affine subspace is **not** a vector space

#### **Definition 2**

Given vectors/points  $x_1, \ldots, x_k \in \mathbb{R}^n$ ,  $\sum \lambda_i x_i$  is called

- linear combination if  $\lambda_i \in \mathbb{R}$ .
- affine combination if  $\lambda_i \in \mathbb{R}$  and  $\sum_i \lambda_i = 1$ .
- convex combination if  $\lambda_i \in \mathbb{R}$  and  $\sum_i \lambda_i = 1$  and  $\lambda_i \ge 0$ .
- conic combination if  $\lambda_i \in \mathbb{R}$  and  $\lambda_i \ge 0$ .

Note that a combination involves only finitely many vectors.

3 Introduction to Linear Programming

#### **Definition 4**

EADS II Harald Räcke

Given a set  $X \subseteq \mathbb{R}^n$ .

- span(X) is the set of all linear combinations of X (linear hull, span)
- aff(X) is the set of all affine combinations of X (affine hull)
- conv(X) is the set of all convex combinations of X (convex hull)
- cone(X) is the set of all conic combinations of X (conic hull)

#### **Definition 5**

A function  $f : \mathbb{R}^n \to \mathbb{R}$  is convex if for  $x, y \in \mathbb{R}^n$  and  $\lambda \in [0, 1]$  we have

 $f(\lambda x + (1 - \lambda)y) \le \lambda f(x) + (1 - \lambda)f(y)$ 

**Lemma 6** If  $P \subseteq \mathbb{R}^n$ , and  $f : \mathbb{R}^n \to \mathbb{R}$  convex then also

 $Q = \{ x \in P \mid f(x) \le t \}$ 

	3 Introduction to Linear Programming	
UUU Harald Räcke		28

**Definition 9** A set  $H \subseteq \mathbb{R}^n$  is a hyperplane if  $H = \{x \mid a^T x = b\}$ , for  $a \neq 0$ .

#### **Definition 10**

A set  $H' \subseteq \mathbb{R}^n$  is a (closed) halfspace if  $H = \{x \mid a^T x \le b\}$ , for  $a \ne 0$ .

#### EADS II Harald Räcke

3 Introduction to Linear Programming

30

## **Dimensions**

#### **Definition 7**

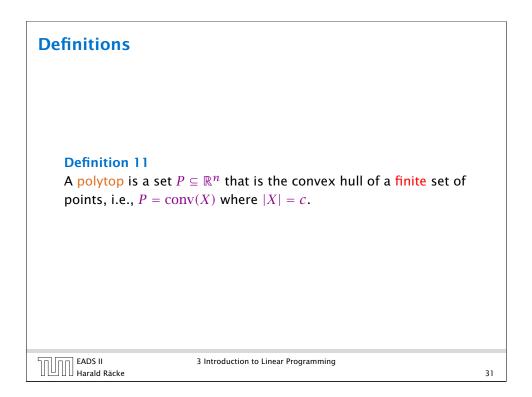

The dimension dim(*A*) of an affine subspace  $A \subseteq \mathbb{R}^n$  is the dimension of the vector space  $\{x - a \mid x \in A\}$ , where  $a \in A$ .

#### **Definition 8**

The dimension  $\dim(X)$  of a convex set  $X \subseteq \mathbb{R}^n$  is the dimension of its affine hull  $\operatorname{aff}(X)$ .

EADS II Harald Räcke

3 Introduction to Linear Programming

## Definitions

**Definition 12** 

A polyhedron is a set  $P \subseteq \mathbb{R}^n$  that can be represented as the intersection of finitely many half-spaces  $\{H(a_1, b_1), \dots, H(a_m, b_m)\}$ , where

 $H(a_i, b_i) = \{x \in \mathbb{R}^n \mid a_i x \le b_i\} .$ 

**Definition 13** A polyhedron *P* is bounded if there exists *B* s.t.  $||x||_2 \le B$  for all  $x \in P$ .

EADS II	3 Introduction to Linear Programming	
🛛 🕒 🛛 🖓 Harald Räcke		32

#### **Definition 15**

Let  $P \subseteq \mathbb{R}^n$ ,  $a \in \mathbb{R}^n$  and  $b \in \mathbb{R}$ . The hyperplane

 $H(a,b) = \{x \in \mathbb{R}^n \mid a^T x = b\}$ 

is a supporting hyperplane of *P* if  $\max\{a^T x \mid x \in P\} = b$ .

#### **Definition 16**

Let  $P \subseteq \mathbb{R}^n$ . *F* is a face of *P* if F = P or  $F = P \cap H$  for some supporting hyperplane *H*.

#### **Definition 17**

Let  $P \subseteq \mathbb{R}^n$ .

- a face v is a vertex of P if  $\{v\}$  is a face of P.
- a face *e* is an edge of *P* if *e* is a face and dim(e) = 1.
- ▶ a face F is a facet of P if F is a face and dim(F) = dim(P) - 1.

3 Introduction to Linear Programming

**Definitions Theorem 14** *P is a bounded polyhedron iff P is a polytop.* 

EADS II Harald Räcke 3 Introduction to Linear Programming

Equivalent definition for vertex:

#### **Definition 18**

Given polyhedron *P*. A point  $x \in P$  is a vertex if  $\exists c \in \mathbb{R}^n$  such that  $c^T y < c^T x$ , for all  $y \in P$ ,  $y \neq x$ .

## Definition 19

Given polyhedron *P*. A point  $x \in P$  is an extreme point if  $\nexists a, b \neq x, a, b \in P$ , with  $\lambda a + (1 - \lambda)b = x$  for  $\lambda \in [0, 1]$ .

## Lemma 20

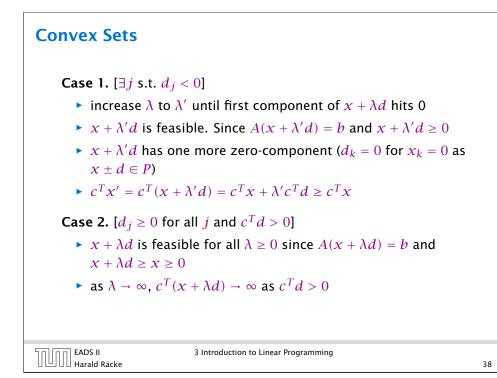

A vertex is also an extreme point.

34

#### Observation

The feasible region of an LP is a Polyhedron.

EADS II	3 Introduction to Linear Programming	
🛛 🕒 🛛 🖓 Harald Räcke		36

## **Convex Sets**

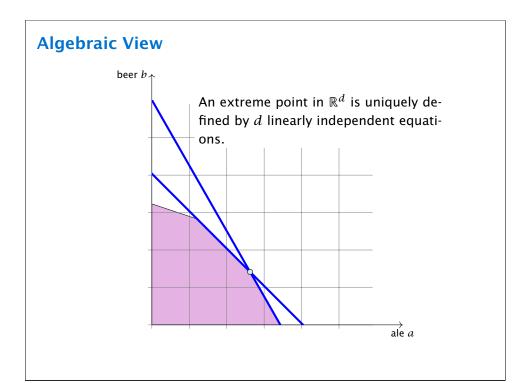

#### Theorem 21

*If there exists an optimal solution to an LP (in standard form) then there exists an optimum solution that is an extreme point.* 

#### Proof

- suppose x is optimal solution that is not extreme point
- there exists direction  $d \neq 0$  such that  $x \pm d \in P$
- Ad = 0 because  $A(x \pm d) = b$
- Wlog. assume  $c^T d \ge 0$  (by taking either d or -d)
- Consider  $x + \lambda d$ ,  $\lambda > 0$

EADS II	3 Introduction to Linear Programming	
UUU Harald Räcke		37

#### Notation

Suppose  $B \subseteq \{1 \dots n\}$  is a set of column-indices. Define  $A_B$  as the subset of columns of A indexed by B.

#### **Theorem 22**

Let  $P = \{x \mid Ax = b, x \ge 0\}$ . For  $x \in P$ , define  $B = \{j \mid x_j > 0\}$ . Then x is extreme point iff  $A_B$  has linearly independent columns.

EADS II Harald Räcke	3 Introduction to Linear Programming

#### **Theorem 22**

Let  $P = \{x \mid Ax = b, x \ge 0\}$ . For  $x \in P$ , define  $B = \{j \mid x_j > 0\}$ . Then x is extreme point iff  $A_B$  has linearly independent columns.

#### Proof (⇒)

- ► assume *A<sub>B</sub>* has linearly dependent columns
- there exists  $d \neq 0$  such that  $A_B d = 0$
- extend *d* to  $\mathbb{R}^n$  by adding 0-components
- now, Ad = 0 and  $d_j = 0$  whenever  $x_j = 0$
- for sufficiently small  $\lambda$  we have  $x \pm \lambda d \in P$
- hence, x is not extreme point

#### Theorem 22

Let  $P = \{x \mid Ax = b, x \ge 0\}$ . For  $x \in P$ , define  $B = \{j \mid x_j > 0\}$ . Then x is extreme point iff  $A_B$  has linearly independent columns.

#### Proof (⇐)

- assume x is not extreme point
- there exists direction d s.t.  $x \pm d \in P$
- Ad = 0 because  $A(x \pm d) = b$
- define  $B' = \{j \mid d_j \neq 0\}$
- $A_{B'}$  has linearly dependent columns as Ad = 0
- $d_j = 0$  for all j with  $x_j = 0$  as  $x \pm d \ge 0$
- Hence,  $B' \subseteq B$ ,  $A_{B'}$  is sub-matrix of  $A_B$

הח הר	EADS II Harald Räcke	3	3 Intr
	Harald Räcke		

#### ntroduction to Linear Programming

#### **Theorem 23**

Let  $P = \{x \mid Ax = b, x \ge 0\}$ . For  $x \in P$ , define  $B = \{j \mid x_j > 0\}$ . If  $A_B$  has linearly independent columns then x is a vertex of P.

• define 
$$c_j = \begin{cases} 0 & j \in B \\ -1 & j \notin B \end{cases}$$

- then  $c^T x = 0$  and  $c^T y \le 0$  for  $y \in P$
- assume  $c^T y = 0$ ; then  $y_j = 0$  for all  $j \notin B$
- $b = Ay = A_By_B = Ax = A_Bx_B$  gives that  $A_B(x_B y_B) = 0$ ;
- this means that  $x_B = y_B$  since  $A_B$  has linearly independent columns
- we get y = x

EADS II Harald Räcke

hence, x is a vertex of P

40

#### Observation

For an LP we can assume wlog. that the matrix A has full row-rank. This means rank(A) = m.

- assume that rank(A) < m
- assume wlog. that the first row A<sub>1</sub> lies in the span of the other rows A<sub>2</sub>,..., A<sub>m</sub>; this means

$$A_1 = \sum_{i=2}^m \lambda_i \cdot A_i$$
, for suitable  $\lambda_i$ 

- **C1** if now  $b_1 = \sum_{i=2}^m \lambda_i \cdot b_i$  then for all x with  $A_i x = b_i$  we also have  $A_1 x = b_1$ ; hence the first constraint is superfluous
- **C2** if  $b_1 \neq \sum_{i=2}^m \lambda_i \cdot b_i$  then the LP is infeasible, since for all x that fulfill constraints  $A_2, \ldots, A_m$  we have

$$A_1 x = \sum_{i=2}^m \lambda_i \cdot A_i x = \sum_{i=2}^m \lambda_i \cdot b_i \neq b_1$$

#### **Theorem 24**

*Given*  $P = \{x \mid Ax = b, x \ge 0\}$ . *x* is extreme point iff there exists  $B \subseteq \{1, ..., n\}$  with |B| = m and

- $\blacktriangleright$  A<sub>B</sub> is non-singular
- $\bullet \ x_B = A_B^{-1}b \ge 0$
- $x_N = 0$

where  $N = \{1, \ldots, n\} \setminus B$ .

#### Proof

Take  $B = \{j \mid x_j > 0\}$  and augment with linearly independent columns until |B| = m; always possible since rank(A) = m.

From now on we will always assume that the constraint matrix of a standard form LP has full row rank.

#### EADS II Harald Räcke

3 Introduction to Linear Programming

45

## **Basic Feasible Solutions** $x \in \mathbb{R}^{n}$ is called basic solution (Basislösung) if Ax = b and $rank(A_{J}) = |J|$ where $J = \{j \mid x_{j} \neq 0\}$ ; x is a basic feasible solution (gültige Basislösung) if in addition $x \ge 0$ . A basis (Basis) is an index set $B \subseteq \{1, ..., n\}$ with $rank(A_{B}) = m$ and |B| = m. $x \in \mathbb{R}^{n}$ with $A_{B}x_{B} = b$ and $x_{j} = 0$ for all $j \notin B$ is the basic solution associated to basis B (die zu *B* assoziierte Basislösung)

## **Basic Feasible Solutions**

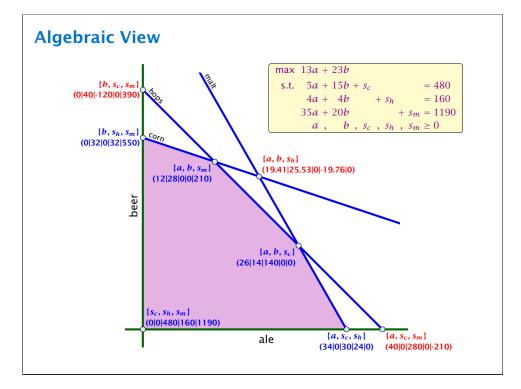

A BFS fulfills the m equality constraints.

In addition, at least n - m of the  $x_i$ 's are zero. The corresponding non-negativity constraint is fulfilled with equality.

#### Fact:

In a BFS at least n constraints are fulfilled with equality.

EADS II Harald Räcke	3 Introduction to Linear Programming	48

## **Basic Feasible Solutions**

#### **Definition 25**

For a general LP (max{ $c^T x | Ax \le b$ }) with n variables a point x is a basic feasible solution if x is feasible and there exist n (linearly independent) constraints that are tight.

#### EADS II Harald Räcke

3 Introduction to Linear Programming

# Fundamental Questions

Linear Programming Problem (LP) Let  $A \in \mathbb{Q}^{m \times n}$ ,  $b \in \mathbb{Q}^m$ ,  $c \in \mathbb{Q}^n$ ,  $\alpha \in \mathbb{Q}$ . Does there exist  $x \in \mathbb{Q}^n$  s.t. Ax = b,  $x \ge 0$ ,  $c^T x \ge \alpha$ ?

#### Questions:

- Is LP in NP? yes!
- Is LP in co-NP?
- ► Is LP in P?

#### Proof:

Given a basis *B* we can compute the associated basis solution by calculating A<sub>B</sub><sup>-1</sup>b in polynomial time; then we can also compute the profit.

#### Observation

We can compute an optimal solution to a linear program in time  $\mathcal{O}\left(\binom{n}{m} \cdot \operatorname{poly}(n,m)\right)$ .

- there are only  $\binom{n}{m}$  different bases.
- compute the profit of each of them and take the maximum

What happens if LP is unbounded?
