Collection of trees that fulfill the heap property.

Structure is much more relaxed than binomial heaps.

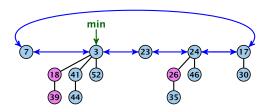

Additional implementation details:

- Every node x stores its degree in a field x. degree. Note that this can be updated in constant time when adding a child to x.
- Every node stores a boolean value x. marked that specifies whether x is marked or not.

The potential function:

- ightharpoonup t(S) denotes the number of trees in the heap.
- \blacktriangleright m(S) denotes the number of marked nodes.
- We use the potential function $\Phi(S) = t(S) + 2m(S)$.

The potential is $\Phi(S) = 5 + 2 \cdot 3 = 11$.

We assume that one unit of potential can pay for a constant amount of work, where the constant is chosen "big enough" (to take care of the constants that occur).

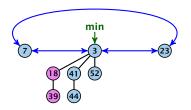

To make this more explicit we use \boldsymbol{c} to denote the amount of work that a unit of potential can pay for.

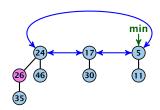

S. minimum()

- Access through the min-pointer.
- Actual cost $\mathcal{O}(1)$.
- No change in potential.
- Amortized cost $\mathcal{O}(1)$.

S. merge(S')

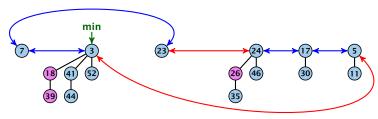

- Merge the root lists.
- Adjust the min-pointer

S. merge(S')

- Merge the root lists.
- Adjust the min-pointer

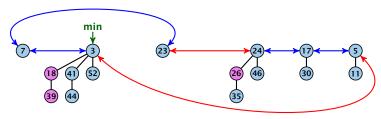

Running time:

Actual cost $\mathcal{O}(1)$.

S. merge(S')

- Merge the root lists.
- Adjust the min-pointer

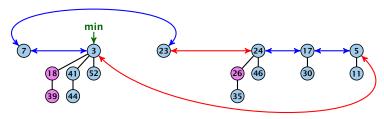

Running time:

- Actual cost $\mathcal{O}(1)$.
- No change in potential.

S. merge(S')

- Merge the root lists.
- Adjust the min-pointer

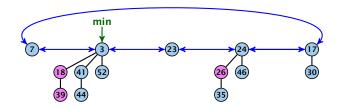

Running time:

- Actual cost $\mathcal{O}(1)$.
- No change in potential.
- ▶ Hence, amortized cost is $\mathcal{O}(1)$.

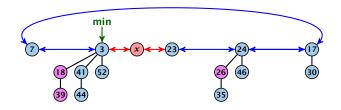

S.insert(x)

- Create a new tree containing x.
- Insert x into the root-list.
- Update min-pointer, if necessary.

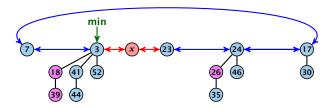

S.insert(x)

- Create a new tree containing x.
- Insert x into the root-list.
- Update min-pointer, if necessary.

S. insert(x)

- Create a new tree containing x.
- Insert x into the root-list.
- Update min-pointer, if necessary.

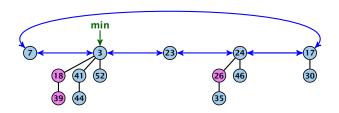

Running time:

- Actual cost $\mathcal{O}(1)$.
- \triangleright Change in potential is +1.
- ▶ Amortized cost is c + O(1) = O(1).

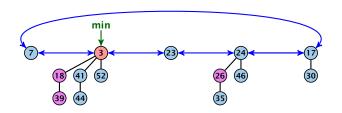

S. delete-min(x)

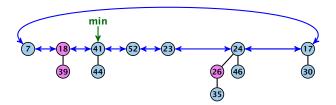

S. delete-min(x)

▶ Delete minimum; add child-trees to heap; time: $D(\min) \cdot \mathcal{O}(1)$.

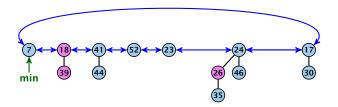

S. delete-min(x)

- ▶ Delete minimum; add child-trees to heap; time: $D(\min) \cdot \mathcal{O}(1)$.
- ▶ Update min-pointer; time: $(t + D(\min)) \cdot \mathcal{O}(1)$.

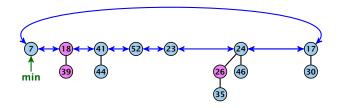

S. delete-min(x)

- ▶ Delete minimum; add child-trees to heap; time: $D(\min) \cdot O(1)$.
- ▶ Update min-pointer; time: $(t + D(\min)) \cdot \mathcal{O}(1)$.

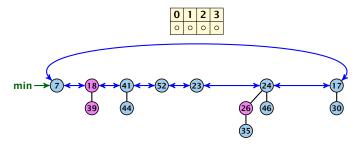

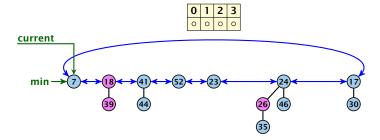

S. delete-min(x)

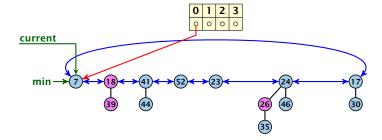

- ▶ Delete minimum; add child-trees to heap; time: $D(\min) \cdot O(1)$.
- ▶ Update min-pointer; time: $(t + D(\min)) \cdot \mathcal{O}(1)$.

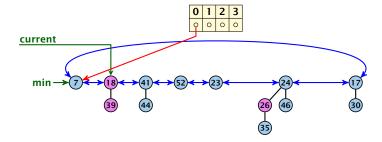

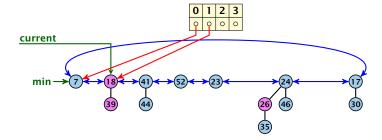

Consolidate root-list so that no roots have the same degree. Time $t \cdot \mathcal{O}(1)$ (see next slide).

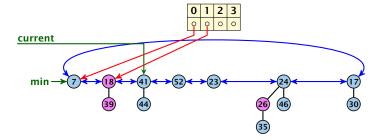

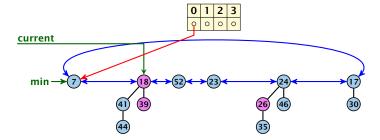

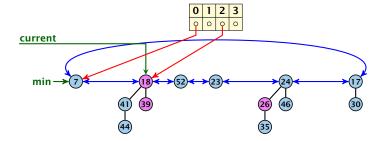

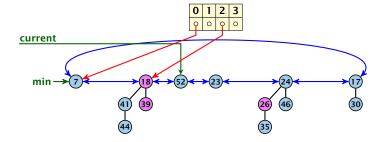

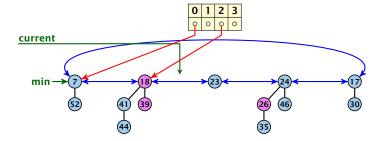

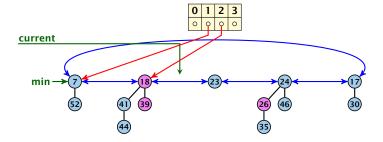

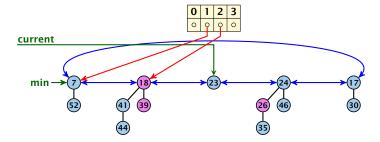

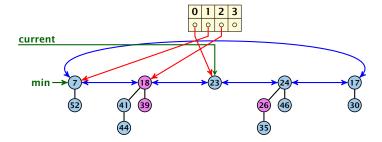

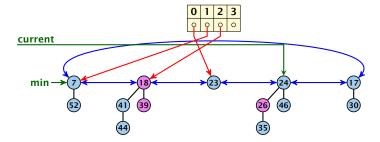

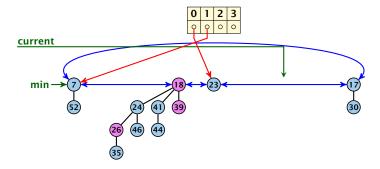

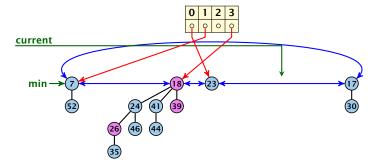

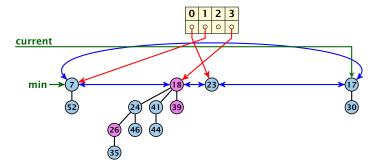

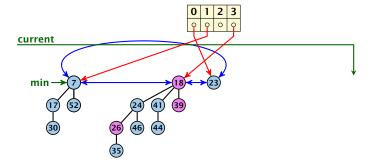

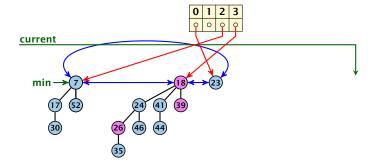

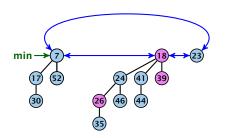

Consolidate:

Actual cost for delete-min()

At most $D_n + t$ elements in root-list before consolidate.

Actual cost for delete-min()

- At most $D_n + t$ elements in root-list before consolidate.
- Actual cost for a delete-min is at most $\mathcal{O}(1) \cdot (D_n + t)$. Hence, there exists c_1 s.t. actual cost is at most $c_1 \cdot (D_n + t)$.

Actual cost for delete-min()

- At most $D_n + t$ elements in root-list before consolidate.
- Actual cost for a delete-min is at most $\mathcal{O}(1) \cdot (D_n + t)$. Hence, there exists c_1 s.t. actual cost is at most $c_1 \cdot (D_n + t)$.

Amortized cost for delete-min()

▶ $t' \le D_n + 1$ as degrees are different after consolidating.

Actual cost for delete-min()

- \triangleright $\mathcal{O}(D_n)$ for delete-min.

Lemma 1

Let x be a node with degree k and let y_1, \ldots, y_k denote the children of x in the order that they were linked to x. Then

$$\operatorname{degree}(y_i) \geq \left\{ \begin{array}{ll} 0 & \textit{if } i = 1 \\ i - 2 & \textit{if } i > 1 \end{array} \right.$$

Proof

- When y_i was linked to x, at least y_1, \ldots, y_{i-1} were already linked to x.
- ▶ Hence, at this time $degree(x) \ge i 1$, and therefore also $degree(y_i) \ge i 1$ as the algorithm links nodes of equal degree only.
- ightharpoonup Since, then y_i has lost at most one child
- ▶ Therefore, degree(y_i) ≥ i 2.

Proof

- When y_i was linked to x, at least y_1, \ldots, y_{i-1} were already linked to x.
- ► Hence, at this time $degree(x) \ge i 1$, and therefore also $degree(y_i) \ge i 1$ as the algorithm links nodes of equal degree only.
- ightharpoonup Since, then y_i has lost at most one child
- ▶ Therefore, degree(y_i) ≥ i 2.

Proof

- When y_i was linked to x, at least y_1, \dots, y_{i-1} were already linked to x.
- ▶ Hence, at this time $degree(x) \ge i 1$, and therefore also $degree(y_i) \ge i - 1$ as the algorithm links nodes of equal degree only.
- Since, then y_i has lost at most one child.

355/358

Proof

$$= 2 + \sum_{i=2}^{k-2} s_i$$

Definition 2

Consider the following non-standard Fibonacci type sequence:

$$F_k = \begin{cases} 1 & \text{if } k = 0 \\ 2 & \text{if } k = 1 \\ F_{k-1} + F_{k-2} & \text{if } k \ge 2 \end{cases}$$

Facts:

- 1. $F_k \geq \phi^k$.
- **2.** For $k \ge 2$: $F_k = 2 + \sum_{i=0}^{k-2} F_i$.

The above facts can be easily proved by induction. From this it follows that $s_k \ge F_k \ge \phi^k$, which gives that the maximum degree in a Fibonacci heap is logarithmic.

k=0:
$$1 = F_0 \ge \Phi^0 = 1$$

k=1: $2 = F_1 \ge \Phi^1 \approx 1.61$
k-2,k-1 \rightarrow k: $F_k = F_{k-1} + F_{k-2} \ge \Phi^{k-1} + \Phi^{k-2} = \Phi^{k-2} (\Phi + 1) = \Phi^k$

k=2:
$$3 = F_2 = 2 + 1 = 2 + F_0$$

k-1 \rightarrow k: $F_k = F_{k-1} + F_{k-2} = 2 + \sum_{i=0}^{k-3} F_i + F_{k-2} = 2 + \sum_{i=0}^{k-2} F_i$
