5/82

#### Recurrences

How do we bring the expression for the number of comparisons ( $\approx$  running time) into a closed form?

For this we need to solve the recurrence.

Ernst Mayr, Harald Räcke

6 Recurrences

22. Feb. 2020

6/82

## **Methods for Solving Recurrences**

#### 1. Guessing+Induction

Guess the right solution and prove that it is correct via induction. It needs experience to make the right guess.

#### 2. Master Theorem

For a lot of recurrences that appear in the analysis of algorithms this theorem can be used to obtain tight asymptotic bounds. It does not provide exact solutions.

#### 3. Characteristic Polynomial

Linear homogenous recurrences can be solved via this method.

## **Methods for Solving Recurrences**

#### 4. Generating Functions

A more general technique that allows to solve certain types of linear inhomogenous relations and also sometimes non-linear recurrence relations.

#### 5. Transformation of the Recurrence

Sometimes one can transform the given recurrence relations so that it e.g. becomes linear and can therefore be solved with one of the other techniques.

## 6.1 Guessing+Induction

First we need to get rid of the  $\mathcal{O}$ -notation in our recurrence:

$$T(n) \le \begin{cases} 2T(\lceil \frac{n}{2} \rceil) + cn & n \ge 2\\ 0 & \text{otherwise} \end{cases}$$

#### Informal way:

Assume that instead we have

$$T(n) \le \begin{cases} 2T(\frac{n}{2}) + cn & n \ge 2\\ 0 & \text{otherwise} \end{cases}$$

One way of solving such a recurrence is to guess a solution, and check that it is correct by plugging it in.

Ernst Mayr, Harald Räcke

6.1 Guessing+Induction

9/82

## 6.1 Guessing+Induction

 $T(n) \le \begin{cases} 2T(\frac{n}{2}) + c\overline{n} & n \ge 16 \end{cases}$ 

**Guess:**  $T(n) \le dn \log n$ .

**Proof.** (by induction)

- **base case**  $(2 \le n < 16)$ : true if we choose  $d \ge b$ .
- ▶ induction step  $n/2 \rightarrow n$ :

Let  $n = 2^k \ge 16$ . Suppose statem. is true for n' = n/2. We prove it for n:

$$T(n) \le 2T\left(\frac{n}{2}\right) + cn$$

$$\le 2\left(d\frac{n}{2}\log\frac{n}{2}\right) + cn$$

$$= dn(\log n - 1) + cn$$

$$= dn\log n + (c - d)n$$

$$\le dn\log n$$
• Note the statem as the  $n = 1$ .
• The balas it is recurrent.

- $\leq 2\left(d\frac{n}{2}\log\frac{n}{2}\right) + cn$  Note that this proves the statement for  $n = 2^k, k \in \mathbb{N}_{\geq 1}$ , as the statement is wrong for
- The base case is usually omitted,  $= dn \log n + (c - d)n$  as it is the same for different recurrences.

Hence, statement is true if we choose  $d \ge c$ .

## 6.1 Guessing+Induction

Suppose we guess  $T(n) \le dn \log n$  for a constant d. Then

$$T(n) \le 2T\left(\frac{n}{2}\right) + cn$$

$$\le 2\left(d\frac{n}{2}\log\frac{n}{2}\right) + cn$$

$$= dn(\log n - 1) + cn$$

$$= dn\log n + (c - d)n$$

$$\le dn\log n$$

if we choose  $d \ge c$ .

Formally, this is not correct if n is not a power of 2. Also even in this case one would need to do an induction proof.

6.1 Guessing+Induction

10/82

## 6.1 Guessing+Induction

How do we get a result for all values of n?

We consider the following recurrence instead of the original one:

$$T(n) \le \begin{cases} 2T(\lceil \frac{n}{2} \rceil) + cn & n \ge 16 \\ b & \text{otherwise} \end{cases}$$

Note that we can do this as for constant-sized inputs the running time is always some constant (b in the above case).

## 6.1 Guessing+Induction

We also make a guess of  $T(n) \le dn \log n$  and get

 $\leq dn \log n$ 

$$T(n) \leq 2T\left(\left\lceil\frac{n}{2}\right\rceil\right) + cn$$

$$\leq 2\left(d\left\lceil\frac{n}{2}\right\rceil\log\left\lceil\frac{n}{2}\right\rceil\right) + cn$$

$$\left\lceil\frac{n}{2}\right\rceil \leq \frac{n}{2} + 1\right\rceil \leq 2\left(d(n/2 + 1)\log(n/2 + 1)\right) + cn$$

$$\left\lceil\frac{n}{2} + 1 \leq \frac{9}{16}n\right\rceil \leq dn\log\left(\frac{9}{16}n\right) + 2d\log n + cn$$

$$\left\lceil\log\frac{9}{16}n\right\rceil = \log n + (\log 9 - 4)\right\rceil = dn\log n + (\log 9 - 4)dn + 2d\log n + cn$$

$$\left\lceil\log n \leq \frac{n}{4}\right\rceil \leq dn\log n + (\log 9 - 3.5)dn + cn$$

$$\leq dn\log n - 0.33dn + cn$$

for a suitable choice of d.

6.1 Guessing+Induction

13/82

#### 6.2 Master Theorem

Note that the cases do not cover all sibilities.

#### Lemma 1

Let  $a \ge 1$ ,  $b \ge 1$  and  $\epsilon > 0$  denote constants. Consider the recurrence

$$T(n) = aT\left(\frac{n}{b}\right) + f(n) .$$

#### Case 1.

If 
$$f(n) = \mathcal{O}(n^{\log_b(a) - \epsilon})$$
 then  $T(n) = \Theta(n^{\log_b a})$ .

#### Case 2.

If 
$$f(n) = \Theta(n^{\log_b(a)} \log^k n)$$
 then  $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$ ,  $k \ge 0$ .

#### Case 3.

If 
$$f(n) = \Omega(n^{\log_b(a) + \epsilon})$$
 and for sufficiently large  $n$   $af(\frac{n}{b}) \le cf(n)$  for some constant  $c < 1$  then  $T(n) = \Theta(f(n))$ .

6.2 Master Theorem

14/82

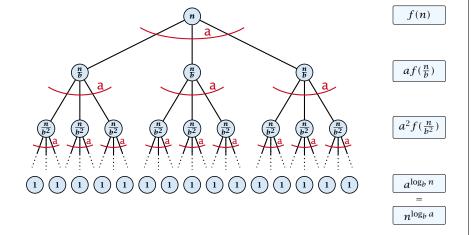

#### 6.2 Master Theorem

We prove the Master Theorem for the case that n is of the form  $b^{\ell}$ , and we assume that the non-recursive case occurs for problem size 1 and incurs cost 1.

## The Recursion Tree

Ernst Mayr, Harald Räcke

The running time of a recursive algorithm can be visualized by a recursion tree:

6.2 Master Theorem

16/82

#### **6.2 Master Theorem**

This gives

$$T(n) = n^{\log_b a} + \sum_{i=0}^{\log_b n-1} a^i f\left(\frac{n}{b^i}\right) .$$

|| | | | | | | | Ernst Mayr, Harald Räcke

6.2 Master Theorem

17/82

#### Case 2. Now suppose that $f(n) \leq c n^{\log_b a}$ .

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n - 1} a^i f\left(\frac{n}{b^i}\right)$$

$$\leq c \sum_{i=0}^{\log_b n - 1} a^i \left(\frac{n}{b^i}\right)^{\log_b a}$$

$$= c n^{\log_b a} \sum_{i=0}^{\log_b n - 1} 1$$

$$= c n^{\log_b a} \log_b n$$

Hence,

$$T(n) = \mathcal{O}(n^{\log_b a} \log_b n)$$
  $\Rightarrow T(n) = \mathcal{O}(n^{\log_b a} \log n).$ 

Case 1. Now suppose that  $f(n) \leq c n^{\log_b a - \epsilon}$ .

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n - 1} a^i f\left(\frac{n}{b^i}\right)$$

$$\leq c \sum_{i=0}^{\log_b n - 1} a^i \left(\frac{n}{b^i}\right)^{\log_b a - \epsilon}$$

$$\begin{aligned} \boxed{b^{-i(\log_b a - \epsilon)} = b^{\epsilon i}(b^{\log_b a})^{-i} = b^{\epsilon i}a^{-i}} &= cn^{\log_b a - \epsilon} \sum_{i=0}^{\log_b n - 1} \left(b^{\epsilon}\right)^i \\ \sum_{i=0}^k q^i = \frac{q^{k+1} - 1}{q - 1} &= cn^{\log_b a - \epsilon} \left(b^{\epsilon \log_b n} - 1\right) / (b^{\epsilon} - 1) \\ &= cn^{\log_b a - \epsilon} (n^{\epsilon} - 1) / (b^{\epsilon} - 1) \\ &= \frac{c}{b^{\epsilon} - 1} n^{\log_b a} (n^{\epsilon} - 1) / (n^{\epsilon}) \end{aligned}$$

Hence.

$$T(n) \le \left(\frac{c}{b^{\epsilon} - 1} + 1\right) n^{\log_b(a)}$$
  $\Rightarrow T(n) = \mathcal{O}(n^{\log_b a}).$ 

Ernst Mayr, Harald Räcke

6.2 Master Theorem

18/82

20/82

Case 2. Now suppose that  $f(n) \ge c n^{\log_b a}$ .

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n - 1} a^i f\left(\frac{n}{b^i}\right)$$

$$\ge c \sum_{i=0}^{\log_b n - 1} a^i \left(\frac{n}{b^i}\right)^{\log_b a}$$

$$= c n^{\log_b a} \sum_{i=0}^{\log_b n - 1} 1$$

$$= c n^{\log_b a} \log_b n$$

Hence,

Ernst Mayr, Harald Räcke

$$T(n) = \mathbf{\Omega}(n^{\log_b a} \log_b n)$$
  $\Rightarrow T(n) = \mathbf{\Omega}(n^{\log_b a} \log n).$ 

6.2 Master Theorem

19/82

6.2 Master Theorem

Case 2. Now suppose that  $f(n) \le c n^{\log_b a} (\log_b(n))^k$ .

$$T(n) - n^{\log_b a} = \sum_{i=0}^{\log_b n - 1} a^i f\left(\frac{n}{b^i}\right)$$

$$\leq c \sum_{i=0}^{\log_b n - 1} a^i \left(\frac{n}{b^i}\right)^{\log_b a} \cdot \left(\log_b \left(\frac{n}{b^i}\right)\right)^k$$

$$n = b^{\ell} \Rightarrow \ell = \log_b n = c n^{\log_b a} \sum_{i=0}^{\ell - 1} \left(\log_b \left(\frac{b^{\ell}}{b^i}\right)\right)^k$$

$$= c n^{\log_b a} \sum_{i=0}^{\ell - 1} (\ell - i)^k$$

$$= c n^{\log_b a} \sum_{i=0}^{\ell - 1} i^k \approx \frac{1}{k} \ell^{k+1}$$

$$\approx \frac{c}{k} n^{\log_b a} \ell^{k+1} \qquad \Rightarrow T(n) = \mathcal{O}(n^{\log_b a} \log^{k+1} n).$$

Ernst Mayr, Harald Räcke

6.2 Master Theorem

22. Feb. 202

21/82

#### **Example: Multiplying Two Integers**

Suppose we want to multiply two n-bit Integers, but our registers can only perform operations on integers of constant size.

For this we first need to be able to add two integers **A** and **B**:

This gives that two n-bit integers can be added in time  $\mathcal{O}(n)$ .

Case 3. Now suppose that  $f(n) \ge dn^{\log_b a + \epsilon}$ , and that for sufficiently large n:  $af(n/b) \le cf(n)$ , for c < 1.

From this we get  $a^i f(n/b^i) \le c^i f(n)$ , where we assume that  $n/b^{i-1} \ge n_0$  is still sufficiently large.

$$\begin{split} T(n) - n^{\log_b a} &= \sum_{i=0}^{\log_b n - 1} a^i f\left(\frac{n}{b^i}\right) \\ &\leq \sum_{i=0}^{\log_b n - 1} c^i f(n) + \mathcal{O}(n^{\log_b a}) \\ &q < 1 : \sum_{i=0}^n q^i = \frac{1 - q^{n+1}}{1 - q} \leq \frac{1}{1 - c} f(n) + \mathcal{O}(n^{\log_b a}) \end{split}$$

Hence,

$$T(n) \le \mathcal{O}(f(n))$$
  $\Rightarrow T(n) = \Theta(f(n)).$ 

Where did we use  $f(n) \ge \Omega(n^{\log_b a + \epsilon})$ ?

Ernst Mayr, Harald Räcke

6.2 Master Theorem

22/82

**Example: Multiplying Two Integers** 

Suppose that we want to multiply an n-bit integer A and an m-bit integer B ( $m \le n$ ).

_	1	0	0	0	1	X	1	0	1	1
						1	0	0	0	1
• This is also nown as the method" for multiplying					1	0	0	0	1	0
• Note that the intermed bers that are generated				0	0	0	0	0	0	0
at most $m + n \le 2n$ bits			4	0	0	0	1	0	0	0
-			1	0	1	1	1	0	1	1

#### Time requirement:

- ▶ Computing intermediate results: O(nm).
- Adding m numbers of length  $\leq 2n$ :  $\mathcal{O}((m+n)m) = \mathcal{O}(nm)$ .

#### **Example: Multiplying Two Integers**

#### A recursive approach:

Suppose that integers **A** and **B** are of length  $n = 2^k$ , for some k.

Then it holds that

$$A = A_1 \cdot 2^{\frac{n}{2}} + A_0$$
 and  $B = B_1 \cdot 2^{\frac{n}{2}} + B_0$ 

Hence,

$$A \cdot B = A_1 B_1 \cdot 2^n + (A_1 B_0 + A_0 B_1) \cdot 2^{\frac{n}{2}} + A_0 B_0$$

6.2 Master Theorem

25/82

## **Example: Multiplying Two Integers**

**Master Theorem:** Recurrence:  $T[n] = aT(\frac{n}{h}) + f(n)$ .

- ► Case 1:  $f(n) = O(n^{\log_b a \epsilon})$  $T(n) = \Theta(n^{\log_b a})$
- ► Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- ► Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

In our case a = 4, b = 2, and  $f(n) = \Theta(n)$ . Hence, we are in Case 1. since  $n = \mathcal{O}(n^{2-\epsilon}) = \mathcal{O}(n^{\log_b a - \epsilon})$ .

We get a running time of  $\mathcal{O}(n^2)$  for our algorithm.

⇒ Not better then the "school method".

#### **Example: Multiplying Two Integers**

#### Algorithm 3 mult(A, B)1: **if** |A| = |B| = 1 **then** $\mathcal{O}(1)$ return $a_0 \cdot b_0$ $\mathcal{O}(1)$ 3: split A into $A_0$ and $A_1$ $\mathcal{O}(n)$ 4: split B into $B_0$ and $B_1$ $\mathcal{O}(n)$ $T(\frac{n}{2})$ 5: $Z_2 \leftarrow \text{mult}(A_1, B_1)$ $2T(\frac{n}{2}) + \mathcal{O}(n)$ 6: $Z_1 \leftarrow \text{mult}(A_1, B_0) + \text{mult}(A_0, B_1)$ $T(\frac{n}{2})$ 7: $Z_0 \leftarrow \text{mult}(A_0, B_0)$ 8: **return** $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$ $\mathcal{O}(n)$

We get the following recurrence:

$$T(n) = 4T\left(\frac{n}{2}\right) + \mathcal{O}(n) .$$

Ernst Mayr, Harald Räcke

6.2 Master Theorem

26/82

## **Example: Multiplying Two Integers**

We can use the following identity to compute  $Z_1$ :

$$Z_1 = A_1 B_0 + A_0 B_1$$
 =  $Z_2$  =  $Z_0$   
=  $(A_0 + A_1) \cdot (B_0 + B_1) - A_1 B_1 - A_0 B_0$ 

Hence,

A more precise

would say that

computing  $Z_1$ 

needs time

(correct) analysis

#### Algorithm 4 mult(A, B)1: **if** |A| = |B| = 1 **then** $\mathcal{O}(1)$ return $a_0 \cdot b_0$ $\mathcal{O}(1)$ 3: split A into $A_0$ and $A_1$ $\mathcal{O}(n)$ 4: split B into $B_0$ and $B_1$ $\mathcal{O}(n)$ $T(\frac{n}{2})$ 5: $Z_2 \leftarrow \text{mult}(A_1, B_1)$ $T(\frac{\bar{n}}{2})$ 6: $Z_0 \leftarrow \text{mult}(A_0, B_0)$ 7: $Z_1 \leftarrow \text{mult}(A_0 + A_1, B_0 + B_1) - Z_2 - Z_0 \mid T(\frac{n}{2}) + \mathcal{O}(n)$ 8: **return** $Z_2 \cdot 2^n + Z_1 \cdot 2^{\frac{n}{2}} + Z_0$ $\mathcal{O}(n)$ $T(\frac{n}{2}+1)+\mathcal{O}(n)$ .

## **Example: Multiplying Two Integers**

We get the following recurrence:

$$T(n) = 3T\left(\frac{n}{2}\right) + \mathcal{O}(n) .$$

**Master Theorem:** Recurrence:  $T[n] = aT(\frac{n}{h}) + f(n)$ .

- ► Case 1:  $f(n) = O(n^{\log_b a \epsilon})$   $T(n) = O(n^{\log_b a})$
- ► Case 2:  $f(n) = \Theta(n^{\log_b a} \log^k n)$   $T(n) = \Theta(n^{\log_b a} \log^{k+1} n)$
- ► Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$   $T(n) = \Theta(f(n))$

Again we are in Case 1. We get a running time of  $\Theta(n^{\log_2 3}) \approx \Theta(n^{1.59}).$ 

A huge improvement over the "school method".

Ernst Mayr, Harald Räcke

6.2 Master Theorem

29/82

#### **Observations:**

- ▶ The solution T[1], T[2], T[3],... is completely determined by a set of boundary conditions that specify values for T[1],...,T[k].
- ▶ In fact, any k consecutive values completely determine the solution.
- k non-concecutive values might not be an appropriate set of boundary conditions (depends on the problem).

#### Approach:

- First determine all solutions that satisfy recurrence relation.
- ▶ Then pick the right one by analyzing boundary conditions.
- First consider the homogenous case.

## 6.3 The Characteristic Polynomial

Consider the recurrence relation:

$$c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$$

This is the general form of a linear recurrence relation of order k with constant coefficients ( $c_0, c_k \neq 0$ ).

- ightharpoonup T(n) only depends on the k preceding values. This means the recurrence relation is of order k.
- $\triangleright$  The recurrence is linear as there are no products of T[n]'s.
- ▶ If f(n) = 0 then the recurrence relation becomes a linear, homogenous recurrence relation of order k.

Note that we ignore boundary conditions for the moment.

Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

30/82

#### 6.3 The Characteristic Polynomial The Homogenous Case

The solution space

$$S = \{ \mathcal{T} = T[1], T[2], T[3], \dots \mid \mathcal{T} \text{ fulfills recurrence relation } \}$$

is a vector space. This means that if  $\mathcal{T}_1, \mathcal{T}_2 \in S$ , then also  $\alpha \mathcal{T}_1 + \beta \mathcal{T}_2 \in S$ , for arbitrary constants  $\alpha, \beta$ .

#### How do we find a non-trivial solution?

We guess that the solution is of the form  $\lambda^n$ ,  $\lambda \neq 0$ , and see what happens. In order for this guess to fulfill the recurrence we need

$$c_0\lambda^n + c_1\lambda^{n-1} + c_2 \cdot \lambda^{n-2} + \cdots + c_k \cdot \lambda^{n-k} = 0$$

for all  $n \ge k$ .

## The Homogenous Case

Dividing by  $\lambda^{n-k}$  gives that all these constraints are identical to

$$\underbrace{c_0 \lambda^k + c_1 \lambda^{k-1} + c_2 \cdot \lambda^{k-2} + \dots + c_k}_{\text{characteristic polynomial } P[\lambda]} = 0$$

This means that if  $\lambda_i$  is a root (Nullstelle) of  $P[\lambda]$  then  $T[n] = \lambda_i^n$ is a solution to the recurrence relation.

Let  $\lambda_1, \ldots, \lambda_k$  be the k (complex) roots of  $P[\lambda]$ . Then, because of the vector space property

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$

is a solution for arbitrary values  $\alpha_i$ .

6.3 The Characteristic Polynomial

Ernst Mayr, Harald Räcke

#### 33/82

34/82

## The Homogenous Case

#### Proof (cont.).

Suppose I am given boundary conditions T[i] and I want to see whether I can choose the  $\alpha'_i s$  such that these conditions are met:

#### The Homogenous Case

#### Lemma 2

Assume that the characteristic polynomial has k distinct roots  $\lambda_1, \ldots, \lambda_k$ . Then all solutions to the recurrence relation are of the form

$$\alpha_1\lambda_1^n + \alpha_2\lambda_2^n + \cdots + \alpha_k\lambda_k^n$$
.

#### Proof.

There is one solution for every possible choice of boundary conditions for  $T[1], \ldots, T[k]$ .

We show that the above set of solutions contains one solution for every choice of boundary conditions.

# Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

## The Homogenous Case

#### Proof (cont.).

Ernst Mayr, Harald Räcke

Suppose I am given boundary conditions T[i] and I want to see whether I can choose the  $\alpha'_i s$  such that these conditions are met:

$$\begin{pmatrix} \lambda_1 & \lambda_2 & \cdots & \lambda_k \\ \lambda_1^2 & \lambda_2^2 & \cdots & \lambda_k^2 \\ & \vdots & & \\ \lambda_1^k & \lambda_2^k & \cdots & \lambda_k^k \end{pmatrix} \begin{pmatrix} \alpha_1 \\ \alpha_2 \\ \vdots \\ \alpha_k \end{pmatrix} = \begin{pmatrix} T[1] \\ T[2] \\ \vdots \\ T[k] \end{pmatrix}$$

We show that the column vectors are linearly independent. Then the above equation has a solution.

## **Computing the Determinant**

$$\begin{vmatrix} \lambda_{1} & \lambda_{2} & \cdots & \lambda_{k-1} & \lambda_{k} \\ \lambda_{1}^{2} & \lambda_{2}^{2} & \cdots & \lambda_{k-1}^{2} & \lambda_{k}^{2} \\ \vdots & \vdots & & \vdots & \vdots \\ \lambda_{1}^{k} & \lambda_{2}^{k} & \cdots & \lambda_{k-1}^{k} & \lambda_{k}^{k} \end{vmatrix} = \prod_{i=1}^{k} \lambda_{i} \cdot \begin{vmatrix} 1 & 1 & \cdots & 1 & 1 \\ \lambda_{1} & \lambda_{2} & \cdots & \lambda_{k-1} & \lambda_{k} \\ \vdots & \vdots & & \vdots & \vdots \\ \lambda_{1}^{k-1} & \lambda_{2}^{k-1} & \cdots & \lambda_{k-1}^{k-1} & \lambda_{k}^{k-1} \end{vmatrix}$$

$$= \prod_{i=1}^{k} \lambda_{i} \cdot \begin{vmatrix} 1 & \lambda_{1} & \cdots & \lambda_{1}^{k-2} & \lambda_{1}^{k-1} \\ 1 & \lambda_{2} & \cdots & \lambda_{2}^{k-2} & \lambda_{2}^{k-1} \\ \vdots & \vdots & & \vdots & \vdots \\ 1 & \lambda_{k} & \cdots & \lambda_{k}^{k-2} & \lambda_{k}^{k-1} \end{vmatrix}$$

6.3 The Characteristic Polynomial

#### 37/82

#### **Computing the Determinant**

$$\begin{vmatrix} 1 & \lambda_{1} & \cdots & \lambda_{1}^{k-2} & \lambda_{1}^{k-1} \\ 1 & \lambda_{2} & \cdots & \lambda_{2}^{k-2} & \lambda_{2}^{k-1} \\ \vdots & \vdots & & \vdots & \vdots \\ 1 & \lambda_{k} & \cdots & \lambda_{k}^{k-2} & \lambda_{k}^{k-1} \end{vmatrix} =$$

$$\begin{vmatrix} 1 & \lambda_{1} - \lambda_{1} \cdot 1 & \cdots & \lambda_{1}^{k-2} - \lambda_{1} \cdot \lambda_{1}^{k-3} & \lambda_{1}^{k-1} - \lambda_{1} \cdot \lambda_{1}^{k-2} \\ 1 & \lambda_{2} - \lambda_{1} \cdot 1 & \cdots & \lambda_{2}^{k-2} - \lambda_{1} \cdot \lambda_{2}^{k-3} & \lambda_{2}^{k-1} - \lambda_{1} \cdot \lambda_{2}^{k-2} \\ \vdots & \vdots & & \vdots & & \vdots \\ 1 & \lambda_{k} - \lambda_{1} \cdot 1 & \cdots & \lambda_{k}^{k-2} - \lambda_{1} \cdot \lambda_{k}^{k-3} & \lambda_{k}^{k-1} - \lambda_{1} \cdot \lambda_{k}^{k-2} \end{vmatrix}$$

Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

## **Computing the Determinant**

$$\begin{vmatrix} 1 & \lambda_1 - \lambda_1 \cdot 1 & \cdots & \lambda_1^{k-2} - \lambda_1 \cdot \lambda_1^{k-3} & \lambda_1^{k-1} - \lambda_1 \cdot \lambda_1^{k-2} \\ 1 & \lambda_2 - \lambda_1 \cdot 1 & \cdots & \lambda_2^{k-2} - \lambda_1 \cdot \lambda_2^{k-3} & \lambda_2^{k-1} - \lambda_1 \cdot \lambda_2^{k-2} \\ \vdots & \vdots & & \vdots & & \vdots \\ 1 & \lambda_k - \lambda_1 \cdot 1 & \cdots & \lambda_k^{k-2} - \lambda_1 \cdot \lambda_k^{k-3} & \lambda_k^{k-1} - \lambda_1 \cdot \lambda_k^{k-2} \end{vmatrix} = \\ \begin{vmatrix} 1 & 0 & \cdots & 0 & 0 \\ 1 & (\lambda_2 - \lambda_1) \cdot 1 & \cdots & (\lambda_2 - \lambda_1) \cdot \lambda_2^{k-3} & (\lambda_2 - \lambda_1) \cdot \lambda_2^{k-2} \\ \vdots & \vdots & & \vdots & & \vdots \\ 1 & (\lambda_k - \lambda_1) \cdot 1 & \cdots & (\lambda_k - \lambda_1) \cdot \lambda_k^{k-3} & (\lambda_k - \lambda_1) \cdot \lambda_k^{k-2} \end{vmatrix}$$

## **Computing the Determinant**

$$\begin{vmatrix} 1 & 0 & \cdots & 0 & 0 \\ 1 & (\lambda_2 - \lambda_1) \cdot 1 & \cdots & (\lambda_2 - \lambda_1) \cdot \lambda_2^{k-3} & (\lambda_2 - \lambda_1) \cdot \lambda_2^{k-2} \\ \vdots & \vdots & & \vdots & \vdots \\ 1 & (\lambda_k - \lambda_1) \cdot 1 & \cdots & (\lambda_k - \lambda_1) \cdot \lambda_k^{k-3} & (\lambda_k - \lambda_1) \cdot \lambda_k^{k-2} \end{vmatrix} =$$

$$\begin{vmatrix} k & & & \\ \prod_{i=2}^k (\lambda_i - \lambda_1) \cdot & & & \vdots \\ 1 & \lambda_k & \cdots & \lambda_k^{k-3} & \lambda_k^{k-2} \\ \vdots & & \vdots & & \vdots \\ 1 & \lambda_k & \cdots & \lambda_k^{k-3} & \lambda_k^{k-2} \end{vmatrix}$$

## **Computing the Determinant**

Repeating the above steps gives:

$$\begin{vmatrix} \lambda_1 & \lambda_2 & \cdots & \lambda_{k-1} & \lambda_k \\ \lambda_1^2 & \lambda_2^2 & \cdots & \lambda_{k-1}^2 & \lambda_k^2 \\ \vdots & \vdots & & \vdots & \vdots \\ \lambda_1^k & \lambda_2^k & \cdots & \lambda_{k-1}^k & \lambda_k^k \end{vmatrix} = \prod_{i=1}^k \lambda_i \cdot \prod_{i>\ell} (\lambda_i - \lambda_\ell)$$

Hence, if all  $\lambda_i$ 's are different, then the determinant is non-zero.

 $\left|\left|\left|\left|\right|\right|\right|$  Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

41/82

This means

$$c_0 n \lambda_i^{n-1} + c_1 (n-1) \lambda_i^{n-2} + \dots + c_k (n-k) \lambda_i^{n-k-1} = 0$$

Hence,

$$c_0 \underbrace{n\lambda_i^n}_{T[n]} + c_1 \underbrace{(n-1)\lambda_i^{n-1}}_{T[n-1]} + \cdots + c_k \underbrace{(n-k)\lambda_i^{n-k}}_{T[n-k]} = 0$$

## The Homogeneous Case

#### What happens if the roots are not all distinct?

Suppose we have a root  $\lambda_i$  with multiplicity (Vielfachheit) at least 2. Then not only is  $\lambda_i^n$  a solution to the recurrence but also  $n\lambda_i^n$ .

To see this consider the polynomial

$$P[\lambda] \cdot \lambda^{n-k} = c_0 \lambda^n + c_1 \lambda^{n-1} + c_2 \lambda^{n-2} + \cdots + c_k \lambda^{n-k}$$

Since  $\lambda_i$  is a root we can write this as  $Q[\lambda] \cdot (\lambda - \lambda_i)^2$ . Calculating the derivative gives a polynomial that still has root  $\lambda_i$ .

Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

42/82

## The Homogeneous Case

Suppose  $\lambda_i$  has multiplicity j. We know that

$$c_0 n \lambda_i^n + c_1 (n-1) \lambda_i^{n-1} + \dots + c_k (n-k) \lambda_i^{n-k} = 0$$

(after taking the derivative; multiplying with  $\lambda$ ; plugging in  $\lambda_i$ )

Doing this again gives

Ernst Mayr, Harald Räcke

$$c_0 n^2 \lambda_i^n + c_1 (n-1)^2 \lambda_i^{n-1} + \dots + c_k (n-k)^2 \lambda_i^{n-k} = 0$$

We can continue j-1 times.

Hence,  $n^{\ell}\lambda_i^n$  is a solution for  $\ell \in 0, ..., j-1$ .

## The Homogeneous Case

#### Lemma 3

Let  $P[\lambda]$  denote the characteristic polynomial to the recurrence

$$c_0T[n] + c_1T[n-1] + \cdots + c_kT[n-k] = 0$$

Let  $\lambda_i$ , i = 1, ..., m be the (complex) roots of  $P[\lambda]$  with multiplicities  $\ell_i$ . Then the general solution to the recurrence is given by

$$T[n] = \sum_{i=1}^{m} \sum_{j=0}^{\ell_i - 1} \alpha_{ij} \cdot (n^j \lambda_i^n) .$$

The full proof is omitted. We have only shown that any choice of  $\alpha_{ii}$ 's is a solution to the recurrence.

6.3 The Characteristic Polynomial

45/82

## **Example: Fibonacci Sequence**

$$T[0] = 0$$

$$T[1] = 1$$

$$T[n] = T[n-1] + T[n-2]$$
 for  $n \ge 2$ 

The characteristic polynomial is

$$\lambda^2 - \lambda - 1$$

Finding the roots, gives

$$\lambda_{1/2} = \frac{1}{2} \pm \sqrt{\frac{1}{4} + 1} = \frac{1}{2} \left( 1 \pm \sqrt{5} \right)$$

Ernst Mayr, Harald Räcke

6.3 The Characteristic Polynomial

46/82

## **Example: Fibonacci Sequence**

Hence, the solution is of the form

$$\alpha \left(\frac{1+\sqrt{5}}{2}\right)^n + \beta \left(\frac{1-\sqrt{5}}{2}\right)^n$$

$$T[0] = 0$$
 gives  $\alpha + \beta = 0$ .

$$T[1] = 1$$
 gives

$$\alpha\left(\frac{1+\sqrt{5}}{2}\right)+\beta\left(\frac{1-\sqrt{5}}{2}\right)=1 \Longrightarrow \alpha-\beta=\frac{2}{\sqrt{5}}$$

## **Example: Fibonacci Sequence**

Hence, the solution is

$$\frac{1}{\sqrt{5}} \left[ \left( \frac{1+\sqrt{5}}{2} \right)^n - \left( \frac{1-\sqrt{5}}{2} \right)^n \right]$$

## The Inhomogeneous Case

Consider the recurrence relation:

$$c_0T(n) + c_1T(n-1) + c_2T(n-2) + \cdots + c_kT(n-k) = f(n)$$

with  $f(n) \neq 0$ .

While we have a fairly general technique for solving homogeneous, linear recurrence relations the inhomogeneous case is different.

6.3 The Characteristic Polynomial

# Ernst Mayr, Harald Räcke

49/82

## The Inhomogeneous Case

Example:

$$T[n] = T[n-1] + 1$$
  $T[0] = 1$ 

Then,

$$T[n-1] = T[n-2] + 1$$
  $(n \ge 2)$ 

Subtracting the first from the second equation gives,

$$T[n] - T[n-1] = T[n-1] - T[n-2]$$
  $(n \ge 2)$ 

or

$$T[n] = 2T[n-1] - T[n-2]$$
  $(n \ge 2)$ 

I get a completely determined recurrence if I add T[0] = 1 and T[1] = 2.

## The Inhomogeneous Case

The general solution of the recurrence relation is

$$T(n) = T_h(n) + T_p(n) ,$$

where  $T_h$  is any solution to the homogeneous equation, and  $T_n$  is one particular solution to the inhomogeneous equation.

There is no general method to find a particular solution.

6.3 The Characteristic Polynomial

50/82

## The Inhomogeneous Case

Example: Characteristic polynomial:

$$\underbrace{\lambda^2 - 2\lambda + 1}_{(\lambda - 1)^2} = 0$$

Then the solution is of the form

$$T[n] = \alpha 1^n + \beta n 1^n = \alpha + \beta n$$

$$T[0] = 1$$
 gives  $\alpha = 1$ .

Ernst Mayr, Harald Räcke

$$T[1] = 2$$
 gives  $1 + \beta = 2 \Longrightarrow \beta = 1$ .

## The Inhomogeneous Case

If f(n) is a polynomial of degree r this method can be applied r+1 times to obtain a homogeneous equation:

$$T[n] = T[n-1] + n^2$$

Shift:

$$T[n-1] = T[n-2] + (n-1)^2 = T[n-2] + n^2 - 2n + 1$$

Difference:

$$T[n] - T[n-1] = T[n-1] - T[n-2] + 2n - 1$$

$$T[n] = 2T[n-1] - T[n-2] + 2n - 1$$

## **6.4 Generating Functions**

#### **Definition 4 (Generating Function)**

Let  $(a_n)_{n\geq 0}$  be a sequence. The corresponding

generating function (Erzeugendenfunktion) is

$$F(z) := \sum_{n>0} a_n z^n ;$$

exponential generating function (exponentielle Erzeugendenfunktion) is

$$F(z) := \sum_{n \ge 0} \frac{a_n}{n!} z^n .$$

$$T[n] = 2T[n-1] - T[n-2] + 2n - 1$$

Shift:

$$T[n-1] = 2T[n-2] - T[n-3] + 2(n-1) - 1$$
$$= 2T[n-2] - T[n-3] + 2n - 3$$

Difference:

$$T[n] - T[n-1] = 2T[n-1] - T[n-2] + 2n - 1$$
  
 $-2T[n-2] + T[n-3] - 2n + 3$ 

$$T[n] = 3T[n-1] - 3T[n-2] + T[n-3] + 2$$

and so on...

## **6.4 Generating Functions**

## Example 5

Ernst Mayr, Harald Räcke

1. The generating function of the sequence (1, 0, 0, ...) is

$$F(z)=1.$$

**2.** The generating function of the sequence (1, 1, 1, ...) is

$$F(z) = \frac{1}{1-z}.$$

## **6.4 Generating Functions**

There are two different views:

A generating function is a formal power series (formale Potenzreihe).

Then the generating function is an algebraic object.

Let  $f = \sum_{n>0} a_n z^n$  and  $g = \sum_{n>0} b_n z^n$ .

- **Equality:** f and g are equal if  $a_n = b_n$  for all n.
- ▶ Addition:  $f + g := \sum_{n>0} (a_n + b_n) z^n$ .
- ▶ Multiplication:  $f \cdot g := \sum_{n>0} c_n z^n$  with  $c_n = \sum_{n=0}^n a_n b_{n-n}$ .

There are no convergence issues here.

Ernst Mayr, Harald Räcke

6.4 Generating Functions

57/82

## **6.4 Generating Functions**

What does  $\sum_{n\geq 0} z^n = \frac{1}{1-z}$  mean in the algebraic view?

It means that the power series 1 - z and the power series  $\sum_{n\geq 0} z^n$  are invers, i.e.,

$$(1-z)\cdot\left(\sum_{n>0}^{\infty}z^n\right)=1.$$

This is well-defined.

## **6.4 Generating Functions**

The arithmetic view:

We view a power series as a function  $f: \mathbb{C} \to \mathbb{C}$ .

Then, it is important to think about convergence/convergence radius etc.

6.4 Generating Functions

58/82

## **6.4 Generating Functions**

Suppose we are given the generating function

$$\sum_{n\geq 0} z^n = \frac{1}{1-z} .$$

Formally the derivative of a formal power series  $\sum_{n\geq 0} a_n z^n$  is defined as  $\sum_{n\geq 0} na_n z^{n-1}$ .

The known rules for differentiation work for this definition. In particular, e.g. the derivative of  $\frac{1}{1-2}$  is

Note that this requires a proof if we consider power series as algebraic objects. However, we did not prove this in the lecture.

We can compute the derivative:

$$\sum_{\substack{n \ge 1 \\ \sum_{n \ge 0} (n+1)z^n}} nz^{n-1} = \frac{1}{(1-z)^2}$$

Hence, the generating function of the sequence  $a_n = n + 1$ is  $1/(1-z)^2$ .

## **6.4 Generating Functions**

We can repeat this

$$\sum_{n\geq 0} (n+1)z^n = \frac{1}{(1-z)^2} .$$

Derivative:

$$\sum_{n\geq 1} n(n+1)z^{n-1} = \frac{2}{(1-z)^3}$$

$$\sum_{n\geq 0} (n+1)(n+2)z^n$$

Hence, the generating function of the sequence  $a_n = (n+1)(n+2)$  is  $\frac{2}{(1-z)^3}$ .

Ernst Mayr, Harald Räcke

6.4 Generating Functions

61/82

#### **6.4 Generating Functions**

Computing the *k*-th derivative of  $\sum z^n$ .

$$\sum_{n \ge k} n(n-1) \cdot \ldots \cdot (n-k+1) z^{n-k} = \sum_{n \ge 0} (n+k) \cdot \ldots \cdot (n+1) z^n$$
$$= \frac{k!}{(1-z)^{k+1}}.$$

Hence:

$$\sum_{n\geq 0} \binom{n+k}{k} z^n = \frac{1}{(1-z)^{k+1}} .$$

The generating function of the sequence  $a_n = \binom{n+k}{k}$  is  $\frac{1}{(1-z)^{k+1}}$ .

6.4 Generating Functions

62/82

## **6.4 Generating Functions**

$$\sum_{n\geq 0} nz^n = \sum_{n\geq 0} (n+1)z^n - \sum_{n\geq 0} z^n$$
$$= \frac{1}{(1-z)^2} - \frac{1}{1-z}$$
$$= \frac{z}{(1-z)^2}$$

The generating function of the sequence  $a_n = n$  is  $\frac{z}{(1-z)^2}$ .

## **6.4 Generating Functions**

We know

$$\sum_{n>0} y^n = \frac{1}{1-y}$$

Hence,

$$\sum_{n>0} a^n z^n = \frac{1}{1 - az}$$

The generating function of the sequence  $f_n = a^n$  is  $\frac{1}{1-az}$ .

#### Example: $a_n = a_{n-1} + 1$ , $a_0 = 1$

Suppose we have the recurrence  $a_n = a_{n-1} + 1$  for  $n \ge 1$  and  $a_0 = 1$ .

$$A(z) = \sum_{n \ge 0} a_n z^n$$

$$= a_0 + \sum_{n \ge 1} (a_{n-1} + 1) z^n$$

$$= 1 + z \sum_{n \ge 1} a_{n-1} z^{n-1} + \sum_{n \ge 1} z^n$$

$$= z \sum_{n \ge 0} a_n z^n + \sum_{n \ge 0} z^n$$

$$= zA(z) + \sum_{n \ge 0} z^n$$

$$= zA(z) + \frac{1}{1 - z}$$

Ernst Mayr, Harald Räcke

6.4 Generating Functions

22. Feb. 2020

65/82

## Example: $a_n = a_{n-1} + 1$ , $a_0 = 1$

Solving for A(z) gives

$$\sum_{n\geq 0} a_n z^n = A(z) = \frac{1}{(1-z)^2} = \sum_{n\geq 0} (n+1) z^n$$

Hence,  $a_n = n + 1$ .

Ernst Mayr, Harald Räcke

## **Solving Recursions with Generating Functions**

- 1. Set  $A(z) = \sum_{n>0} a_n z^n$ .
- 2. Transform the right hand side so that boundary condition and recurrence relation can be plugged in.
- 3. Do further transformations so that the infinite sums on the right hand side can be replaced by A(z).
- **4.** Solving for A(z) gives an equation of the form A(z) = f(z), where hopefully f(z) is a simple function.
- 5. Write f(z) as a formal power series. Techniques:
  - partial fraction decomposition (Partialbruchzerlegung)
  - lookup in tables
- **6.** The coefficients of the resulting power series are the  $a_n$ .

Ernst Mayr, Harald Räcke

6.4 Generating Functions

69/82

3. Transform right hand side so that infinite sums can be replaced by A(z) or by simple function.

$$A(z) = 1 + \sum_{n \ge 1} (2a_{n-1})z^n$$

$$= 1 + 2z \sum_{n \ge 1} a_{n-1}z^{n-1}$$

$$= 1 + 2z \sum_{n \ge 0} a_n z^n$$

$$= 1 + 2z \cdot A(z)$$

**4.** Solve for A(z).

$$A(z) = \frac{1}{1 - 2z}$$

## Example: $a_n = 2a_{n-1}, a_0 = 1$

1. Set up generating function:

$$A(z) = \sum_{n>0} a_n z^n$$

2. Transform right hand side so that recurrence can be plugged in:

$$A(z) = a_0 + \sum_{n>1} a_n z^n$$

2. Plug in:

$$A(z) = 1 + \sum_{n \ge 1} (2a_{n-1})z^n$$

Ernst Mayr, Harald Räcke

6.4 Generating Functions

70/82

## Example: $a_n = 2a_{n-1}, a_0 = 1$

$$A(z) = 1 + \sum_{n \ge 1} (2a_{n-1})z^n$$

$$= 1 + 2z \sum_{n \ge 1} a_{n-1}z^{n-1}$$

$$= 1 + 2z \sum_{n \ge 0} a_n z^n$$

$$= 1 + 2z \cdot A(z)$$

6.4 Generating Functions

## Example: $a_n = 2a_{n-1}, a_0 = 1$

**5.** Rewrite f(z) as a power series:

$$\sum_{n\geq 0} a_n z^n = A(z) = \frac{1}{1 - 2z} = \sum_{n\geq 0} 2^n z^n$$

## Example: $a_n = 3a_{n-1} + n$ , $a_0 = 1$

1. Set up generating function:

$$A(z) = \sum_{n \ge 0} a_n z^n$$

Ernst Mayr, Harald Räcke

6.4 Generating Functions

73/82

## Example: $a_n = 3a_{n-1} + n$ , $a_0 = 1$

**4.** Solve for A(z):

$$A(z) = 1 + 3zA(z) + \frac{z}{(1-z)^2}$$

gives

$$A(z) = \frac{(1-z)^2 + z}{(1-3z)(1-z)^2} = \frac{z^2 - z + 1}{(1-3z)(1-z)^2}$$

## Example: $a_n = 3a_{n-1} + n$ , $a_0 = 1$

2./3. Transform right hand side:

$$A(z) = \sum_{n \ge 0} a_n z^n$$

$$= a_0 + \sum_{n \ge 1} a_n z^n$$

$$= 1 + \sum_{n \ge 1} (3a_{n-1} + n) z^n$$

$$= 1 + 3z \sum_{n \ge 1} a_{n-1} z^{n-1} + \sum_{n \ge 1} n z^n$$

$$= 1 + 3z \sum_{n \ge 0} a_n z^n + \sum_{n \ge 0} n z^n$$

$$= 1 + 3z A(z) + \frac{z}{(1-z)^2}$$

Ernst Mayr, Harald Räcke

6.4 Generating Functions

74/82

## Example: $a_n = 3a_{n-1} + n$ , $a_0 = 1$

**5.** Write f(z) as a formal power series:

We use partial fraction decomposition:

$$\frac{z^2 - z + 1}{(1 - 3z)(1 - z)^2} \stackrel{!}{=} \frac{A}{1 - 3z} + \frac{B}{1 - z} + \frac{C}{(1 - z)^2}$$

This gives

Ernst Mayr, Harald Räcke

$$z^{2} - z + 1 = A(1 - z)^{2} + B(1 - 3z)(1 - z) + C(1 - 3z)$$

$$= A(1 - 2z + z^{2}) + B(1 - 4z + 3z^{2}) + C(1 - 3z)$$

$$= (A + 3B)z^{2} + (-2A - 4B - 3C)z + (A + B + C)$$

## Example: $a_n = 3a_{n-1} + n$ , $a_0 = 1$

**5.** Write f(z) as a formal power series:

This leads to the following conditions:

$$A + B + C = 1$$
$$2A + 4B + 3C = 1$$
$$A + 3B = 1$$

which gives

$$A = \frac{7}{4}$$
  $B = -\frac{1}{4}$   $C = -\frac{1}{2}$ 

||||||||| Ernst Mayr, Harald Räcke

6.4 Generating Functions

#### 77/82

## Example: $a_n = 3a_{n-1} + n$ , $a_0 = 1$

**5.** Write f(z) as a formal power series:

$$A(z) = \frac{7}{4} \cdot \frac{1}{1 - 3z} - \frac{1}{4} \cdot \frac{1}{1 - z} - \frac{1}{2} \cdot \frac{1}{(1 - z)^2}$$

$$= \frac{7}{4} \cdot \sum_{n \ge 0} 3^n z^n - \frac{1}{4} \cdot \sum_{n \ge 0} z^n - \frac{1}{2} \cdot \sum_{n \ge 0} (n + 1) z^n$$

$$= \sum_{n \ge 0} \left(\frac{7}{4} \cdot 3^n - \frac{1}{4} - \frac{1}{2}(n + 1)\right) z^n$$

$$= \sum_{n \ge 0} \left(\frac{7}{4} \cdot 3^n - \frac{1}{2}n - \frac{3}{4}\right) z^n$$

**6.** This means  $a_n = \frac{7}{4}3^n - \frac{1}{2}n - \frac{3}{4}$ .

The struction of the structure of the st

6.4 Generating Functions

78/82

#### 6.5 Transformation of the Recurrence

#### Example 6

$$f_0 = 1$$

$$f_1 = 2$$

$$f_n = f_{n-1} \cdot f_{n-2} \text{ for } n \ge 2.$$

Define

$$g_n := \log f_n$$
.

Then

$$g_n = g_{n-1} + g_{n-2}$$
 for  $n \ge 2$   
 $g_1 = \log 2 = 1$  (for  $\log = \log_2$ ),  $g_0 = 0$   
 $g_n = F_n$  (*n*-th Fibonacci number)  
 $f_n = 2^{F_n}$ 

#### 6.5 Transformation of the Recurrence

#### Example 7

$$f_1=1$$
 
$$f_n=3f_{\frac{n}{2}}+n; \text{ for } n=2^k, \ k\geq 1 \ ;$$

Define

$$g_k := f_{2^k}$$
.

Then:

$$g_0 = 1$$
  
 $g_k = 3g_{k-1} + 2^k, \ k \ge 1$ 

#### **6 Recurrences**

We get

$$g_k = 3 [g_{k-1}] + 2^k$$

$$= 3 [3g_{k-2} + 2^{k-1}] + 2^k$$

$$= 3^2 [g_{k-2}] + 32^{k-1} + 2^k$$

$$= 3^2 [3g_{k-3} + 2^{k-2}] + 32^{k-1} + 2^k$$

$$= 3^3 g_{k-3} + 3^2 2^{k-2} + 32^{k-1} + 2^k$$

$$= 2^k \cdot \sum_{i=0}^k \left(\frac{3}{2}\right)^i$$

$$= 2^k \cdot \frac{\left(\frac{3}{2}\right)^{k+1} - 1}{\frac{1}{2}} = 3^{k+1} - 2^{k+1}$$

$$n = 2^k$$
:

$$g_k = 3^{k+1} - 2^{k+1}$$
, hence  
 $f_n = 3 \cdot 3^k - 2 \cdot 2^k$   
 $= 3(2^{\log 3})^k - 2 \cdot 2^k$   
 $= 3(2^k)^{\log 3} - 2 \cdot 2^k$   
 $= 3n^{\log 3} - 2n$ .
