Lemma 5

The length of the shortest augmenting path never decreases.

#### Lemma 5

The length of the shortest augmenting path never decreases.

#### Lemma 6

After at most  $\mathcal{O}(m)$  augmentations, the length of the shortest augmenting path strictly increases.

These two lemmas give the following theorem:

These two lemmas give the following theorem:

#### **Theorem 7**

The shortest augmenting path algorithm performs at most O(mn) augmentations. This gives a running time of  $O(m^2n)$ .

These two lemmas give the following theorem:

#### Theorem 7

The shortest augmenting path algorithm performs at most O(mn) augmentations. This gives a running time of  $O(m^2n)$ .

### Proof.

We can find the shortest augmenting paths in time O(m) via BFS.

These two lemmas give the following theorem:

#### Theorem 7

The shortest augmenting path algorithm performs at most O(mn) augmentations. This gives a running time of  $O(m^2n)$ .

### Proof.

- We can find the shortest augmenting paths in time  $\mathcal{O}(m)$  via BFS.
- $\mathcal{O}(m)$  augmentations for paths of exactly k < n edges.

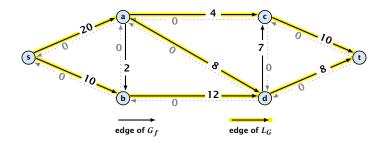

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-v path in  $G_f$  (along non-zero edges).

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

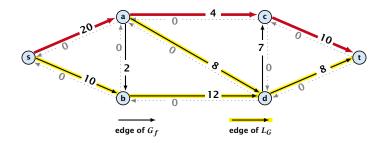

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

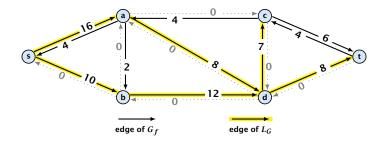

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

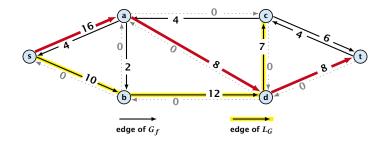

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

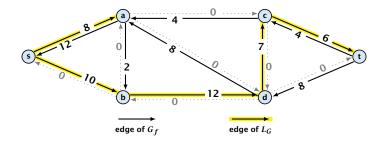

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

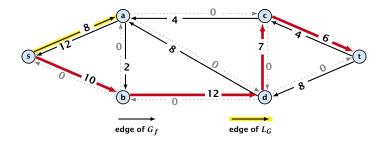

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

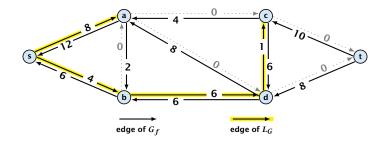

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

Define the level  $\ell(v)$  of a node as the length of the shortest *s*-*v* path in  $G_f$  (along non-zero edges).

Let  $L_G$  denote the subgraph of the residual graph  $G_f$  that contains only those edges (u, v) with  $\ell(v) = \ell(u) + 1$ .

In the following we assume that the residual graph  $G_f$  does not contain zero capacity edges.

This means, we construct it in the usual sense and then delete edges of zero capacity.

First Lemma:

The length of the shortest augmenting path never decreases.

### First Lemma:

The length of the shortest augmenting path never decreases.

After an augmentation  $G_f$  changes as follows:

Bottleneck edges on the chosen path are deleted.

### First Lemma:

The length of the shortest augmenting path never decreases.

After an augmentation  $G_f$  changes as follows:

- Bottleneck edges on the chosen path are deleted.
- Back edges are added to all edges that don't have back edges so far.

### First Lemma:

The length of the shortest augmenting path never decreases.

After an augmentation  $G_f$  changes as follows:

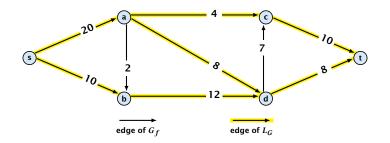

- Bottleneck edges on the chosen path are deleted.
- Back edges are added to all edges that don't have back edges so far.

**Second Lemma:** After at most m augmentations the length of the shortest augmenting path strictly increases.

**Second Lemma:** After at most m augmentations the length of the shortest augmenting path strictly increases.

Let M denote the set of edges in graph  $L_G$  at the beginning of a round when the distance between s and t is k.

**Second Lemma:** After at most m augmentations the length of the shortest augmenting path strictly increases.

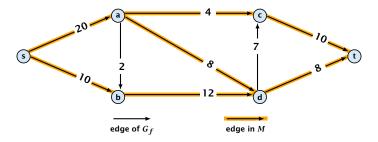

Let M denote the set of edges in graph  $L_G$  at the beginning of a round when the distance between s and t is k.

An *s*-*t* path in  $G_f$  that uses edges not in *M* has length larger than k, even when using edges added to  $G_f$  during the round.

**Second Lemma:** After at most m augmentations the length of the shortest augmenting path strictly increases.

#### Theorem 8

The shortest augmenting path algorithm performs at most O(mn) augmentations. Each augmentation can be performed in time O(m).

#### Theorem 8

The shortest augmenting path algorithm performs at most O(mn) augmentations. Each augmentation can be performed in time O(m).

#### **Theorem 9 (without proof)**

There exist networks with  $m = \Theta(n^2)$  that require  $\mathcal{O}(mn)$  augmentations, when we restrict ourselves to only augment along shortest augmenting paths.

#### Theorem 8

The shortest augmenting path algorithm performs at most O(mn) augmentations. Each augmentation can be performed in time O(m).

#### **Theorem 9 (without proof)**

There exist networks with  $m = \Theta(n^2)$  that require  $\mathcal{O}(mn)$  augmentations, when we restrict ourselves to only augment along shortest augmenting paths.

#### Note:

There always exists a set of m augmentations that gives a maximum flow (why?).

When sticking to shortest augmenting paths we cannot improve (asymptotically) on the number of augmentations.

When sticking to shortest augmenting paths we cannot improve (asymptotically) on the number of augmentations.

However, we can improve the running time to  $\mathcal{O}(mn^2)$  by improving the running time for finding an augmenting path (currently we assume  $\mathcal{O}(m)$  per augmentation for this).

We maintain a subset M of the edges of  $G_f$  with the guarantee that a shortest s-t path using only edges from M is a shortest augmenting path.

We maintain a subset M of the edges of  $G_f$  with the guarantee that a shortest s-t path using only edges from M is a shortest augmenting path.

With each augmentation some edges are deleted from M.

We maintain a subset M of the edges of  $G_f$  with the guarantee that a shortest s-t path using only edges from M is a shortest augmenting path.

With each augmentation some edges are deleted from M.

When M does not contain an s-t path anymore the distance between s and t strictly increases.

We maintain a subset M of the edges of  $G_f$  with the guarantee that a shortest *s*-*t* path using only edges from M is a shortest augmenting path.

With each augmentation some edges are deleted from M.

When M does not contain an s-t path anymore the distance between s and t strictly increases.

Note that M is not the set of edges of the level graph but a subset of level-graph edges.

M is initialized as the level graph  $L_G$ .

M is initialized as the level graph  $L_G$ .

Perform a DFS search to find a path from s to t using edges from M.

M is initialized as the level graph  $L_G$ .

Perform a DFS search to find a path from s to t using edges from M.

Either you find t after at most n steps, or you end at a node v that does not have any outgoing edges.

M is initialized as the level graph  $L_G$ .

Perform a DFS search to find a path from s to t using edges from M.

Either you find t after at most n steps, or you end at a node v that does not have any outgoing edges.

You can delete incoming edges of v from M.

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time  $\mathcal{O}(m)$ .

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time  $\mathcal{O}(m)$ .

The total cost for searching for augmenting paths during a phase is at most O(mn), since every search (successful (i.e., reaching t) or unsuccessful) decreases the number of edges in M and takes time O(n).

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time  $\mathcal{O}(m)$ .

The total cost for searching for augmenting paths during a phase is at most  $\mathcal{O}(mn)$ , since every search (successful (i.e., reaching t) or unsuccessful) decreases the number of edges in M and takes time  $\mathcal{O}(n)$ .

The total cost for performing an augmentation during a phase is only  $\mathcal{O}(n)$ . For every edge in the augmenting path one has to update the residual graph  $G_f$  and has to check whether the edge is still in M for the next search.

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time  $\mathcal{O}(m)$ .

The total cost for searching for augmenting paths during a phase is at most  $\mathcal{O}(mn)$ , since every search (successful (i.e., reaching t) or unsuccessful) decreases the number of edges in M and takes time  $\mathcal{O}(n)$ .

The total cost for performing an augmentation during a phase is only  $\mathcal{O}(n)$ . For every edge in the augmenting path one has to update the residual graph  $G_f$  and has to check whether the edge is still in M for the next search.

There are at most *n* phases. Hence, total cost is  $O(mn^2)$ .
