# Complexity

#### LP Feasibility Problem (LP feasibility A)

Given  $A \in \mathbb{Z}^{m \times n}$ ,  $b \in \mathbb{Z}^m$ . Does there exist  $x \in \mathbb{R}^n$  with  $Ax \le b$ ,  $x \ge 0$ ?

#### **LP** Feasibility Problem (LP feasibility B) Given $A \in \mathbb{Z}^{m \times n}$ , $b \in \mathbb{Z}^m$ . Find $x \in \mathbb{R}^n$ with $Ax \le b$ , $x \ge 0$ !

#### **LP** Optimization A

Given  $A \in \mathbb{Z}^{m \times n}$ ,  $b \in \mathbb{Z}^m$ ,  $c \in \mathbb{Z}^n$ . What is the maximum value of  $c^T x$  for a feasible point  $x \in \mathbb{R}^n$ ?

#### LP Optimization B

Given  $A \in \mathbb{Z}^{m \times n}$ ,  $b \in \mathbb{Z}^m$ ,  $c \in \mathbb{Z}^n$ . Return feasible point  $x \in \mathbb{R}^n$  with maximum value of  $c^T x$ ?

Note that allowing A, b to contain rational numbers does not make a difference, as we can multiply every number by a suitable large constant so that everything becomes integral but the feasible region does not change.

### **The Bit Model**

#### Input size

• The number of bits to represent a number  $a \in \mathbb{Z}$  is

 $\lceil \log_2(|a|) \rceil + 1$ 

Let for an  $m \times n$  matrix M, L(M) denote the number of bits required to encode all the numbers in M.

$$\langle M \rangle := \sum_{i,j} \lceil \log_2(|m_{ij}|) + 1 \rceil$$

- In the following we assume that input matrices are encoded in a standard way, where each number is encoded in binary and then suitable separators are added in order to separate distinct number from each other.
- Then the input length is  $L = \Theta(\langle A \rangle + \langle b \rangle)$ .

- In the following we sometimes refer to L := ⟨A⟩ + ⟨b⟩ as the input size (even though the real input size is something in Θ(⟨A⟩ + ⟨b⟩)).
- Sometimes we may also refer to L := ⟨A⟩ + ⟨b⟩ + n log<sub>2</sub> n as the input size. Note that n log<sub>2</sub> n = Θ(⟨A⟩ + ⟨b⟩).
- In order to show that LP-decision is in NP we show that if there is a solution x then there exists a small solution for which feasibility can be verified in polynomial time (polynomial in L).

```
Note that m \log_2 m may be much larger than \langle A \rangle + \langle b \rangle.
```

Suppose that  $\bar{A}x = b$ ;  $x \ge 0$  is feasible.

Then there exists a basic feasible solution. This means a set B of basic variables such that

 $x_B = \bar{A}_B^{-1} b$ 

and all other entries in x are 0.

In the following we show that this x has small encoding length and we give an explicit bound on this length. So far we have only been handwaving and have said that we can compute x via Gaussian elimination and it will be short...

# Size of a Basic Feasible Solution the number of columns in A which

A: original input matrix

- Note that n in the theorem denotes may be much smaller than *m*.
- Ā: transformation of A into standard form
- $\blacktriangleright$   $\bar{A}_{B}$ : submatrix of  $\bar{A}$  corresponding to basis B

#### Lemma 47

Let  $\bar{A}_B \in \mathbb{Z}^{m \times m}$  and  $b \in \mathbb{Z}^m$ . Define  $L = \langle A \rangle + \langle b \rangle + n \log_2 n$ . Then a solution to  $\bar{A}_B x_B = b$  has rational components  $x_i$  of the form  $\frac{D_j}{D}$ , where  $|D_j| \leq 2^L$  and  $|D| \leq 2^L$ .

#### Proof:

Cramers rules says that we can compute  $x_i$  as

$$x_j = \frac{\det(\bar{A}_B^j)}{\det(\bar{A}_B)}$$

where  $\bar{A}_{R}^{j}$  is the matrix obtained from  $\bar{A}_{B}$  by replacing the *j*-th column by the vector **b**.

# **Bounding the Determinant**

Let  $X = \overline{A}_R$ . Then  $|\det(X)| = |\det(\bar{X})|$  $= \left| \sum_{\pi \in S_{\tilde{n}}} \operatorname{sgn}(\pi) \prod_{1 \le i \le \tilde{n}} \bar{X}_{i\pi(i)} \right|$  $\leq \sum_{\pi \in S_{\tilde{n}}} \prod_{1 \leq i \leq \tilde{n}} |\bar{X}_{i\pi(i)}|$ When computing the determinant of  $X = \bar{A}_R$  $\leq n! \cdot 2^{\langle A \rangle + \langle b \rangle} \leq 2^{L}$  we first do expansions along columns that were introduced when transforming A into standard form, i.e., into  $\bar{A}$ . Here  $\bar{X}$  is an  $\tilde{n} \times \tilde{n}$  submatrix of A Such a column contains a single 1 and the remaining entries of the column are 0. with  $\tilde{n} < n$ . Therefore, these expansions do not increase the absolute value of the determinant. After we did expansions for all these columns we Analogously for  $det(A_R^J)$ . are left with a square sub-matrix of A of size at most  $n \times n$ .

### **Reducing LP-solving to LP decision.**

Given an LP max{ $c^T x | Ax \le b; x \ge 0$ } do a binary search for the optimum solution

(Add constraint  $c^T x \ge M$ ). Then checking for feasibility shows whether optimum solution is larger or smaller than M).

If the LP is feasible then the binary search finishes in at most

$$\log_2\left(\frac{2n2^{2L'}}{1/2^{L'}}\right) = \mathcal{O}(L') ,$$

as the range of the search is at most  $-n2^{2L'}, \ldots, n2^{2L'}$  and the distance between two adjacent values is at least  $\frac{1}{\det(A)} \ge \frac{1}{2^{L'}}$ .

Here we use  $L' = \langle A \rangle + \langle b \rangle + \langle c \rangle + n \log_2 n$  (it also includes the encoding size of *c*).

#### How do we detect whether the LP is unbounded?

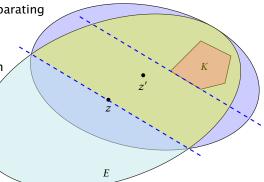

Let  $M_{\text{max}} = n2^{2L'}$  be an upper bound on the objective value of a basic feasible solution.

We can add a constraint  $c^T x \ge M_{max} + 1$  and check for feasibility.

# **Ellipsoid Method**

- Let *K* be a convex set.
- Maintain ellipsoid E that is guaranteed to contain K provided that K is non-empty.
- If center  $z \in K$  STOP.
- Otw. find a hyperplane separating K from z (e.g. a violated constraint in the LP).
- Shift hyperplane to contain node z. H denotes halfspace that contains K.
- Compute (smallest) ellipsoid E' that contains  $E \cap H$ .
- REPEAT

9 The Ellipsoid Algorithm

8. Jul. 2022 175/217

#### Issues/Questions:

- How do you choose the first Ellipsoid? What is its volume?
- How do you measure progress? By how much does the volume decrease in each iteration?
- When can you stop? What is the minimum volume of a non-empty polytop?

#### **Definition 48**

A mapping  $f : \mathbb{R}^n \to \mathbb{R}^n$  with f(x) = Lx + t, where *L* is an invertible matrix is called an affine transformation.

#### **Definition 49**

A ball in  $\mathbb{R}^n$  with center *c* and radius *r* is given by

$$B(c,r) = \{x \mid (x-c)^T (x-c) \le r^2\} \\ = \{x \mid \sum_i (x-c)_i^2 / r^2 \le 1\}$$

B(0,1) is called the unit ball.

#### **Definition 50**

An affine transformation of the unit ball is called an ellipsoid.

From f(x) = Lx + t follows  $x = L^{-1}(f(x) - t)$ .

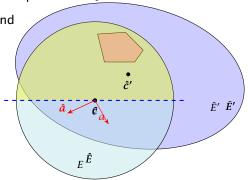

$$f(B(0,1)) = \{f(x) \mid x \in B(0,1)\}$$
  
=  $\{y \in \mathbb{R}^n \mid L^{-1}(y-t) \in B(0,1)\}$   
=  $\{y \in \mathbb{R}^n \mid (y-t)^T L^{-1} L^{-1}(y-t) \le 1\}$   
=  $\{y \in \mathbb{R}^n \mid (y-t)^T Q^{-1}(y-t) \le 1\}$ 

where  $Q = LL^T$  is an invertible matrix.

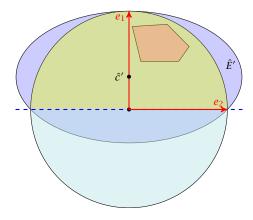

# How to Compute the New Ellipsoid

- Use  $f^{-1}$  (recall that f = Lx + t is the affine transformation of the unit ball) to rotate/distort the ellipsoid (back) into the unit ball.
- Use a rotation R<sup>-1</sup> to rotate the unit ball such that the normal vector of the halfspace is parallel to e<sub>1</sub>.
- Compute the new center ĉ' and the new matrix Q̂' for this simplified setting.
- Use the transformations *R* and *f* to get the new center *c'* and the new matrix *Q'* for the original ellipsoid *E*.

8. Jul. 2022 180/217

- The new center lies on axis  $x_1$ . Hence,  $\hat{c}' = te_1$  for t > 0.
- ► The vectors  $e_1, e_2, ...$  have to fulfill the ellipsoid constraint with equality. Hence  $(e_i \hat{c}')^T \hat{Q}'^{-1} (e_i \hat{c}') = 1$ .

- To obtain the matrix  $\hat{Q'}^{-1}$  for our ellipsoid  $\hat{E'}$  note that  $\hat{E'}$  is axis-parallel.
- Let a denote the radius along the x<sub>1</sub>-axis and let b denote the (common) radius for the other axes.
- The matrix

$$\hat{L}' = \begin{pmatrix} a & 0 & \dots & 0 \\ 0 & b & \ddots & \vdots \\ \vdots & \ddots & \ddots & 0 \\ 0 & \dots & 0 & b \end{pmatrix}$$

maps the unit ball (via function  $\hat{f}'(x) = \hat{L}'x$ ) to an axis-parallel ellipsoid with radius a in direction  $x_1$  and b in all other directions.

• As  $\hat{Q}' = \hat{L}' \hat{L}'^t$  the matrix  $\hat{Q}'^{-1}$  is of the form

$$\hat{Q'}^{-1} = \begin{pmatrix} \frac{1}{a^2} & 0 & \dots & 0\\ 0 & \frac{1}{b^2} & \ddots & \vdots\\ \vdots & \ddots & \ddots & 0\\ 0 & \dots & 0 & \frac{1}{b^2} \end{pmatrix}$$

9 The Ellipsoid Algorithm

8. Jul. 2022 183/217

$$(e_1 - \hat{c}')^T \hat{Q}'^{-1} (e_1 - \hat{c}') = 1 \text{ gives}$$

$$\begin{pmatrix} 1 - t \\ 0 \\ \vdots \\ 0 \end{pmatrix}^T \cdot \begin{pmatrix} \frac{1}{a^2} & 0 & \cdots & 0 \\ 0 & \frac{1}{b^2} & \ddots & \vdots \\ \vdots & \ddots & \ddots & 0 \\ 0 & \cdots & 0 & \frac{1}{b^2} \end{pmatrix} \cdot \begin{pmatrix} 1 - t \\ 0 \\ \vdots \\ 0 \end{pmatrix} = 1$$

• This gives  $(1 - t)^2 = a^2$ .

9 The Ellipsoid Algorithm

8. Jul. 2022 184/217

For  $i \neq 1$  the equation  $(e_i - \hat{c}')^T \hat{Q}'^{-1} (e_i - \hat{c}') = 1$  looks like (here i = 2)

$$\begin{pmatrix} -t \\ 1 \\ 0 \\ \vdots \\ 0 \end{pmatrix}^{T} \cdot \begin{pmatrix} \frac{1}{a^{2}} & 0 & \dots & 0 \\ 0 & \frac{1}{b^{2}} & \ddots & \vdots \\ \vdots & \ddots & \ddots & 0 \\ 0 & \dots & 0 & \frac{1}{b^{2}} \end{pmatrix} \cdot \begin{pmatrix} -t \\ 1 \\ 0 \\ \vdots \\ 0 \end{pmatrix} = 1$$

This gives 
$$\frac{t^2}{a^2} + \frac{1}{b^2} = 1$$
, and hence  
 $\frac{1}{b^2} = 1 - \frac{t^2}{a^2} = 1 - \frac{t^2}{(1-t)^2} = \frac{1-2t}{(1-t)^2}$ 

### **Summary**

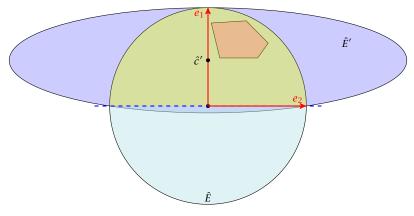

So far we have

$$a = 1 - t$$
 and  $b = \frac{1 - t}{\sqrt{1 - 2t}}$ 

8. Jul. 2022 186/217

We still have many choices for *t*:

Choose *t* such that the volume of  $\hat{E}'$  is minimal!!!

9 The Ellipsoid Algorithm

8. Jul. 2022 187/217

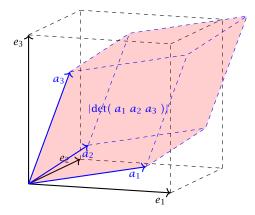

#### We want to choose t such that the volume of $\hat{E}'$ is minimal.

#### **Lemma 51** Let *L* be an affine transformation and $K \subseteq \mathbb{R}^n$ . Then

 $\operatorname{vol}(L(K)) = |\det(L)| \cdot \operatorname{vol}(K)$ .

# n-dimensional volume

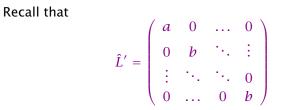

9 The Ellipsoid Algorithm

8. Jul. 2022 189/217

• We want to choose t such that the volume of  $\hat{E}'$  is minimal.

 $\operatorname{vol}(\hat{E}') = \operatorname{vol}(B(0,1)) \cdot |\operatorname{det}(\hat{L}')| \ ,$ 

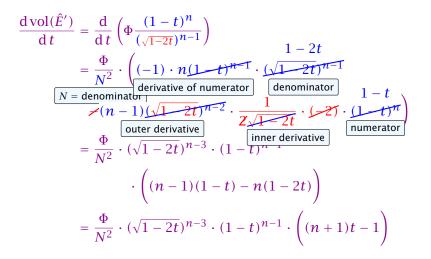

Note that a and b in the above equations depend on t, by the previous equations.

$$vol(\hat{E}') = vol(B(0,1)) \cdot |det(\hat{L}')|$$
  
=  $vol(B(0,1)) \cdot ab^{n-1}$   
=  $vol(B(0,1)) \cdot (1-t) \cdot \left(\frac{1-t}{\sqrt{1-2t}}\right)^{n-1}$   
=  $vol(B(0,1)) \cdot \frac{(1-t)^n}{(\sqrt{1-2t})^{n-1}}$ 

We use the shortcut  $\Phi := \operatorname{vol}(B(0, 1))$ .

8. Jul. 2022 192/217

• We obtain the minimum for  $t = \frac{1}{n+1}$ .

For this value we obtain

$$a = 1 - t = \frac{n}{n+1}$$
 and  $b = \frac{1-t}{\sqrt{1-2t}} = \frac{n}{\sqrt{n^2-1}}$ 

To see the equation for b, observe that

$$b^{2} = \frac{(1-t)^{2}}{1-2t} = \frac{(1-\frac{1}{n+1})^{2}}{1-\frac{2}{n+1}} = \frac{(\frac{n}{n+1})^{2}}{\frac{n-1}{n+1}} = \frac{n^{2}}{n^{2}-1}$$

9 The Ellipsoid Algorithm

8. Jul. 2022 193/217

Let  $\gamma_n = \frac{\operatorname{vol}(\hat{E}')}{\operatorname{vol}(B(0,1))} = ab^{n-1}$  be the ratio by which the volume changes:

$$y_n^2 = \left(\frac{n}{n+1}\right)^2 \left(\frac{n^2}{n^2 - 1}\right)^{n-1}$$
  
=  $\left(1 - \frac{1}{n+1}\right)^2 \left(1 + \frac{1}{(n-1)(n+1)}\right)^{n-1}$   
 $\leq e^{-2\frac{1}{n+1}} \cdot e^{\frac{1}{n+1}}$   
=  $e^{-\frac{1}{n+1}}$ 

where we used  $(1 + x)^a \le e^{ax}$  for  $x \in \mathbb{R}$  and a > 0.

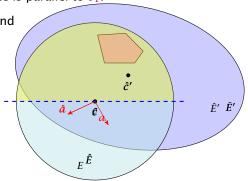

This gives  $\gamma_n \leq e^{-\frac{1}{2(n+1)}}$ .

8. Jul. 2022 194/217

# How to Compute the New Ellipsoid

- Use  $f^{-1}$  (recall that f = Lx + t is the affine transformation of the unit ball) to translate/distort the ellipsoid (back) into the unit ball.
- Use a rotation R<sup>-1</sup> to rotate the unit ball such that the normal vector of the halfspace is parallel to e<sub>1</sub>.
- Compute the new center ĉ' and the new matrix Q̂' for this simplified setting.
- Use the transformations *R* and *f* to get the new center *c'* and the new matrix *Q'* for the original ellipsoid *E*.

Our progress is the same:

$$e^{-\frac{1}{2(n+1)}} \ge \frac{\operatorname{vol}(\hat{E}')}{\operatorname{vol}(B(0,1))} = \frac{\operatorname{vol}(\hat{E}')}{\operatorname{vol}(\hat{E})} = \frac{\operatorname{vol}(R(\hat{E}'))}{\operatorname{vol}(R(\hat{E}))}$$
$$= \frac{\operatorname{vol}(\bar{E}')}{\operatorname{vol}(\bar{E})} = \frac{\operatorname{vol}(f(\bar{E}'))}{\operatorname{vol}(f(\bar{E}))} = \frac{\operatorname{vol}(E')}{\operatorname{vol}(E)}$$

Here it is important that mapping a set with affine function f(x) = Lx + t changes the volume by factor det(*L*).

### **The Ellipsoid Algorithm**

#### How to compute the new parameters?

The transformation function of the (old) ellipsoid: f(x) = Lx + c;

The halfspace to be intersected:  $H = \{x \mid a^T(x - c) \le 0\};\$ 

$$f^{-1}(H) = \{f^{-1}(x) \mid a^{T}(x-c) \le 0\}$$
  
=  $\{f^{-1}(f(y)) \mid a^{T}(f(y)-c) \le 0\}$   
=  $\{y \mid a^{T}(f(y)-c) \le 0\}$   
=  $\{y \mid a^{T}(Ly+c-c) \le 0\}$   
=  $\{y \mid (a^{T}L)y \le 0\}$ 

This means  $\bar{a} = L^T a$ .

The center  $\bar{c}$  is of course at the origin.

### **The Ellipsoid Algorithm**

After rotating back (applying  $R^{-1}$ ) the normal vector of the halfspace points in negative  $x_1$ -direction. Hence,

$$R^{-1}\left(\frac{L^{T}a}{\|L^{T}a\|}\right) = -e_{1} \quad \Rightarrow \quad -\frac{L^{T}a}{\|L^{T}a\|} = R \cdot e_{1}$$

Hence,

$$\bar{c}' = R \cdot \hat{c}' = R \cdot \frac{1}{n+1} e_1 = -\frac{1}{n+1} \frac{L^T a}{\|L^T a\|}$$

$$\begin{aligned} c' &= f(\bar{c}') = L \cdot \bar{c}' + c \\ &= -\frac{1}{n+1} L \frac{L^T a}{\|L^T a\|} + c \\ &= c - \frac{1}{n+1} \frac{Q a}{\sqrt{a^T Q a}} \end{aligned}$$

For computing the matrix Q' of the new ellipsoid we assume in the following that  $\hat{E}', \bar{E}'$  and E' refer to the ellipsoids centered in the origin.

#### Recall that

$$\hat{Q}' = \begin{pmatrix} a^2 & 0 & \dots & 0 \\ 0 & b^2 & \ddots & \vdots \\ \vdots & \ddots & \ddots & 0 \\ 0 & \dots & 0 & b^2 \end{pmatrix}$$

because for  $a^2 = n^2/(n+1)^2$  and  $b^2 = n^2/n^2-1$ 

$$b^{2} - b^{2} \frac{2}{n+1} = \frac{n^{2}}{n^{2}-1} - \frac{2n^{2}}{(n-1)(n+1)^{2}}$$
$$= \frac{n^{2}(n+1) - 2n^{2}}{(n-1)(n+1)^{2}} = \frac{n^{2}(n-1)}{(n-1)(n+1)^{2}} = a^{2}$$

# 9 The Ellipsoid Algorithm

$$\begin{split} \bar{E}' &= R(\hat{E}') \\ &= \{R(x) \mid x^T \hat{Q}'^{-1} x \le 1\} \\ &= \{y \mid (R^{-1}y)^T \hat{Q}'^{-1} R^{-1} y \le 1\} \\ &= \{y \mid y^T (R^T)^{-1} \hat{Q}'^{-1} R^{-1} y \le 1\} \\ &= \{y \mid y^T (\underline{R} \hat{Q}' R^T)^{-1} y \le 1\} \\ &= \{y \mid y^T (\underline{R} \hat{Q}' R^T)^{-1} y \le 1\} \end{split}$$

8. Jul. 2022 201/217

# 9 The Ellipsoid Algorithm

Hence,

$$\begin{split} \bar{Q}' &= R\hat{Q}'R^T \\ &= R \cdot \frac{n^2}{n^2 - 1} \left( I - \frac{2}{n+1} e_1 e_1^T \right) \cdot R^T \\ &= \frac{n^2}{n^2 - 1} \left( R \cdot R^T - \frac{2}{n+1} (Re_1) (Re_1)^T \right) \\ &= \frac{n^2}{n^2 - 1} \left( I - \frac{2}{n+1} \frac{L^T a a^T L}{\|L^T a\|^2} \right) \end{split}$$

Here we used the equation for  $Re_1$  proved before, and the fact that  $RR^T = I$ , which holds for any rotation matrix. To see this observe that the length of a rotated vector x should not change, i.e.,

$$x^T I x = (Rx)^T (Rx) = x^T (R^T R) x$$

which means  $x^T(I - R^T R)x = 0$  for every vector x. It is easy to see that this can only be fulfilled if  $I - R^T R = 0$ .

## 9 The Ellipsoid Algorithm

$$E' = L(\bar{E}')$$
  
= {L(x) |  $x^T \bar{Q}'^{-1} x \le 1$ }  
= { $y$  |  $(L^{-1}y)^T \bar{Q}'^{-1} L^{-1} y \le 1$ }  
= { $y$  |  $y^T (L^T)^{-1} \bar{Q}'^{-1} L^{-1} y \le 1$ }  
= { $y$  |  $y^T (\underline{L} \bar{Q}' L^T)^{-1} y \le 1$ }

9 The Ellipsoid Algorithm

8. Jul. 2022 203/217

# 9 The Ellipsoid Algorithm

Hence,

$$Q' = L\bar{Q}'L^{T}$$
$$= L \cdot \frac{n^{2}}{n^{2}-1} \left(I - \frac{2}{n+1} \frac{L^{T}aa^{T}L}{a^{T}Qa}\right) \cdot L^{T}$$
$$= \frac{n^{2}}{n^{2}-1} \left(Q - \frac{2}{n+1} \frac{Qaa^{T}Q}{a^{T}Qa}\right)$$

9 The Ellipsoid Algorithm

8. Jul. 2022 204/217

## **Incomplete Algorithm**

#### Algorithm 1 ellipsoid-algorithm

- 1: **input:** point  $c \in \mathbb{R}^n$ , convex set  $K \subseteq \mathbb{R}^n$
- 2: **output:** point  $x \in K$  or "K is empty"

10: endif

11: until ???

12: return "K is empty"

## **Repeat: Size of basic solutions**

#### Lemma 52

Let  $P = \{x \in \mathbb{R}^n \mid Ax \le b\}$  be a bounded polyhedron. Let  $L := 2\langle A \rangle + \langle b \rangle + 2n(1 + \log_2 n)$ . Then every entry  $x_j$  in a basic solution fulfills  $|x_j| = \frac{D_j}{D}$  with  $D_j, D \le 2^L$ .

In the following we use  $\delta := 2^L$ .

#### Proof:

We can replace *P* by  $P' := \{x \mid A'x \le b; x \ge 0\}$  where A' = [A - A]. The lemma follows by applying Lemma 47, and observing that  $\langle A' \rangle = 2\langle A \rangle$  and n' = 2n.

## How do we find the first ellipsoid?

For feasibility checking we can assume that the polytop P is bounded; it is sufficient to consider basic solutions.

Every entry  $x_i$  in a basic solution fulfills  $|x_i| \le \delta$ .

Hence, *P* is contained in the cube  $-\delta \le x_i \le \delta$ .

A vector in this cube has at most distance  $R := \sqrt{n}\delta$  from the origin.

Starting with the ball  $E_0 := B(0, R)$  ensures that P is completely contained in the initial ellipsoid. This ellipsoid has volume at most  $R^n \operatorname{vol}(B(0, 1)) \le (n\delta)^n \operatorname{vol}(B(0, 1))$ .

#### When can we terminate?

Let  $P := \{x \mid Ax \leq b\}$  with  $A \in \mathbb{Z}$  and  $b \in \mathbb{Z}$  be a bounded polytop.

Consider the following polyhedron

$$P_{\lambda} := \left\{ x \mid Ax \leq b + rac{1}{\lambda} \begin{pmatrix} 1 \\ \vdots \\ 1 \end{pmatrix} 
ight\} ,$$

where  $\lambda = \delta^2 + 1$ .

#### Note that the volume of $P_{\lambda}$ cannot be 0

# **Lemma 53** $P_{\lambda}$ is feasible if and only if P is feasible.

←: obvious!

⇒:

Consider the polyhedrons

$$\bar{P} = \left\{ x \mid \left[ A - A I_m \right] x = b; x \ge 0 \right\}$$

and

$$\bar{P}_{\lambda} = \left\{ x \mid \left[ A - A I_m \right] x = b + \frac{1}{\lambda} \begin{pmatrix} 1 \\ \vdots \\ 1 \end{pmatrix}; x \ge 0 \right\}.$$

P is feasible if and only if  $\overline{P}$  is feasible, and  $P_{\lambda}$  feasible if and only if  $\overline{P}_{\lambda}$  feasible.

 $\bar{P}_{\lambda}$  is bounded since  $P_{\lambda}$  and P are bounded.

Let 
$$\overline{A} = \begin{bmatrix} A & -A & I_m \end{bmatrix}$$
.

 $\bar{{\it P}}_{\lambda}$  feasible implies that there is a basic feasible solution represented by

$$\boldsymbol{x}_{B} = \bar{A}_{B}^{-1}\boldsymbol{b} + \frac{1}{\lambda}\bar{A}_{B}^{-1} \begin{pmatrix} 1\\ \vdots\\ 1 \end{pmatrix}$$

(The other x-values are zero)

The only reason that this basic feasible solution is not feasible for  $\bar{P}$  is that one of the basic variables becomes negative.

Hence, there exists i with

$$(\bar{A}_B^{-1}b)_i < 0 \le (\bar{A}_B^{-1}b)_i + \frac{1}{\lambda}(\bar{A}_B^{-1}\vec{1})_i$$

By Cramers rule we get

$$(\bar{A}_B^{-1}b)_i < 0 \quad \Longrightarrow \quad (\bar{A}_B^{-1}b)_i \le -\frac{1}{\det(\bar{A}_B)} \le -1/\delta$$

and

$$(\bar{A}_B^{-1}\vec{1})_i \leq \det(\bar{A}_B^j) \leq \delta$$
 ,

where  $\bar{A}_B^j$  is obtained by replacing the *j*-th column of  $\bar{A}_B$  by  $\vec{1}$ .

But then

$$(\bar{A}_B^{-1}b)_i + \frac{1}{\lambda}(\bar{A}_B^{-1}\vec{1})_i \le -1/\delta + \delta/\lambda < 0$$
,

as we chose  $\lambda = \delta^2 + 1$ . Contradiction.

8. Jul. 2022 212/217

#### Lemma 54

If  $P_{\lambda}$  is feasible then it contains a ball of radius  $r := 1/\delta^3$ . This has a volume of at least  $r^n \operatorname{vol}(B(0,1)) = \frac{1}{\delta^{3n}} \operatorname{vol}(B(0,1))$ .

#### Proof:

If  $P_{\lambda}$  feasible then also P. Let x be feasible for P. This means  $Ax \leq b$ .

Let 
$$\vec{\ell}$$
 with  $\|\vec{\ell}\| \le r$ . Then  
 $(A(x + \vec{\ell}))_i = (Ax)_i + (A\vec{\ell})_i \le b_i + \vec{a}_i^T \vec{\ell}$   
 $\le b_i + \|\vec{a}_i\| \cdot \|\vec{\ell}\| \le b_i + \sqrt{n} \cdot 2^{\langle a_{\max} \rangle} \cdot r$   
 $\le b_i + \frac{\sqrt{n} \cdot 2^{\langle a_{\max} \rangle}}{\delta^3} \le b_i + \frac{1}{\delta^2 + 1} \le b_i + \frac{1}{\lambda}$ 

Hence,  $x + \vec{\ell}$  is feasible for  $P_{\lambda}$  which proves the lemma.

How many iterations do we need until the volume becomes too small?

$$e^{-\frac{i}{2(n+1)}} \cdot \operatorname{vol}(B(0,R)) < \operatorname{vol}(B(0,r))$$

Hence,

$$\begin{split} i &> 2(n+1)\ln\left(\frac{\operatorname{vol}(B(0,R))}{\operatorname{vol}(B(0,r))}\right) \\ &= 2(n+1)\ln\left(n^n\delta^n\cdot\delta^{3n}\right) \\ &= 8n(n+1)\ln(\delta) + 2(n+1)n\ln(n) \\ &= \mathcal{O}(\operatorname{poly}(n)\cdot L) \end{split}$$

Algorithm 1 ellipsoid-algorithm

1: **input:** point  $c \in \mathbb{R}^n$ , convex set  $K \subseteq \mathbb{R}^n$ , radii *R* and *r* 

- 2: with  $K \subseteq B(c, R)$ , and  $B(x, r) \subseteq K$  for some x
- 3: **output:** point  $x \in K$  or "K is empty"

4: 
$$Q \leftarrow \operatorname{diag}(R^2, \dots, R^2) // \text{ i.e., } L = \operatorname{diag}(R, \dots, R)$$

5: repeat

6: **if** 
$$c \in K$$
 then return  $c$ 

С

7: else

- 8: choose a violated hyperplane *a*
- 9:

$$\leftarrow c - \frac{1}{n+1} \frac{Qa}{\sqrt{a^T Qa}}$$

10: 
$$Q \leftarrow \frac{n^2}{n^2 - 1} \left( Q - \frac{2}{n+1} \frac{Qaa^T Q}{a^T Qaa} \right)$$

11: endif

12: **until** 
$$det(Q) \le r^{2n} // i.e., det(L) \le r^n$$

13: return "K is empty"

#### **Separation Oracle**

Let  $K \subseteq \mathbb{R}^n$  be a convex set. A separation oracle for K is an algorithm A that gets as input a point  $x \in \mathbb{R}^n$  and either

- certifies that  $x \in K$ ,
- or finds a hyperplane separating x from K.

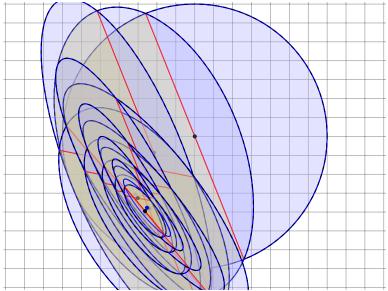

We will usually assume that A is a polynomial-time algorithm.

In order to find a point in *K* we need

- a guarantee that a ball of radius r is contained in K,
- an initial ball B(c, R) with radius R that contains K,
- a separation oracle for K.

The Ellipsoid algorithm requires  $\mathcal{O}(\operatorname{poly}(n) \cdot \log(R/r))$  iterations. Each iteration is polytime for a polynomial-time Separation oracle.
