From the graph G = (V, E, c) and the current flow f we construct an auxiliary graph $G_f = (V, E_f, c_f)$ (the residual graph):

From the graph G = (V, E, c) and the current flow f we construct an auxiliary graph $G_f = (V, E_f, c_f)$ (the residual graph):

Suppose the original graph has edges e₁ = (u, v), and e₂ = (v, u) between u and v.

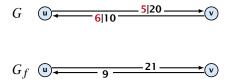

From the graph G = (V, E, c) and the current flow f we construct an auxiliary graph $G_f = (V, E_f, c_f)$ (the residual graph):

- Suppose the original graph has edges e₁ = (u, v), and e₂ = (v, u) between u and v.
- G_f has edge e'_1 with capacity $\max\{0, c(e_1) f(e_1) + f(e_2)\}$ and e'_2 with with capacity $\max\{0, c(e_2) - f(e_2) + f(e_1)\}$.

From the graph G = (V, E, c) and the current flow f we construct an auxiliary graph $G_f = (V, E_f, c_f)$ (the residual graph):

- Suppose the original graph has edges $e_1 = (u, v)$, and $e_2 = (v, u)$ between u and v.
- G_f has edge e'_1 with capacity $\max\{0, c(e_1) f(e_1) + f(e_2)\}$ and e'_2 with with capacity $\max\{0, c(e_2) - f(e_2) + f(e_1)\}$.

Definition 37

An augmenting path with respect to flow f, is a path from s to t in the auxiliary graph G_f that contains only edges with non-zero capacity.

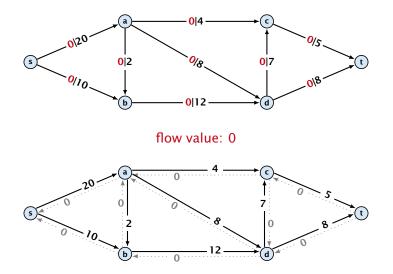

Definition 37

An augmenting path with respect to flow f, is a path from s to t in the auxiliary graph G_f that contains only edges with non-zero capacity.

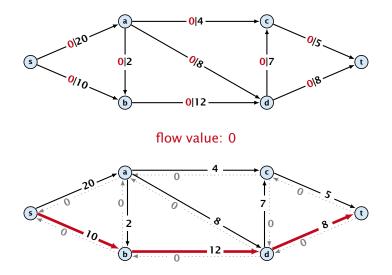

Algorithm 1 FordFulkerson(G = (V, E, c)) 1: Initialize $f(e) \leftarrow 0$ for all edges. 2: while \exists augmenting path p in G_f do 3: augment as much flow along p as possible.

Theorem 38

A flow f is a maximum flow **iff** there are no augmenting paths.

Theorem 38

A flow f is a maximum flow **iff** there are no augmenting paths.

Theorem 39

The value of a maximum flow is equal to the value of a minimum cut.

Theorem 38

A flow f is a maximum flow **iff** there are no augmenting paths.

Theorem 39

The value of a maximum flow is equal to the value of a minimum cut.

Proof.

Let f be a flow. The following are equivalent:

1. There exists a cut *A* such that $val(f) = cap(A, V \setminus A)$.

Theorem 38

A flow f is a maximum flow **iff** there are no augmenting paths.

Theorem 39

The value of a maximum flow is equal to the value of a minimum cut.

Proof.

Let f be a flow. The following are equivalent:

- **1.** There exists a cut A such that $val(f) = cap(A, V \setminus A)$.
- **2.** Flow f is a maximum flow.

Theorem 38

A flow f is a maximum flow **iff** there are no augmenting paths.

Theorem 39

The value of a maximum flow is equal to the value of a minimum cut.

Proof.

Let f be a flow. The following are equivalent:

- **1.** There exists a cut A such that $val(f) = cap(A, V \setminus A)$.
- **2.** Flow f is a maximum flow.
- 3. There is no augmenting path w.r.t. f.

7.1 The Generic Augmenting Path Algorithm

 $1. \Rightarrow 2.$

This we already showed.

 $1. \Rightarrow 2.$

This we already showed.

 $2. \Rightarrow 3.$

If there were an augmenting path, we could improve the flow. Contradiction.

 $1. \Rightarrow 2.$

This we already showed.

 $2. \Rightarrow 3.$

If there were an augmenting path, we could improve the flow. Contradiction.

 $3. \Rightarrow 1.$

Let *f* be a flow with no augmenting paths.

 $1. \Rightarrow 2.$

This we already showed.

 $2. \Rightarrow 3.$

If there were an augmenting path, we could improve the flow. Contradiction.

 $3. \Rightarrow 1.$

- Let f be a flow with no augmenting paths.
- Let A be the set of vertices reachable from s in the residual graph along non-zero capacity edges.

 $1. \Rightarrow 2.$

This we already showed.

 $2. \Rightarrow 3.$

If there were an augmenting path, we could improve the flow. Contradiction.

 $3. \Rightarrow 1.$

- Let f be a flow with no augmenting paths.
- Let A be the set of vertices reachable from s in the residual graph along non-zero capacity edges.
- Since there is no augmenting path we have $s \in A$ and $t \notin A$.

 $\operatorname{val}(f)$

7.1 The Generic Augmenting Path Algorithm

$$\operatorname{val}(f) = \sum_{e \in \operatorname{out}(A)} f(e) - \sum_{e \in \operatorname{into}(A)} f(e)$$

7.1 The Generic Augmenting Path Algorithm

$$\operatorname{val}(f) = \sum_{e \in \operatorname{out}(A)} f(e) - \sum_{e \in \operatorname{into}(A)} f(e)$$
$$= \sum_{e \in \operatorname{out}(A)} c(e)$$

$$\operatorname{val}(f) = \sum_{e \in \operatorname{out}(A)} f(e) - \sum_{e \in \operatorname{into}(A)} f(e)$$
$$= \sum_{e \in \operatorname{out}(A)} c(e)$$
$$= \operatorname{cap}(A, V \setminus A)$$

Augmenting Path Algorithm

$$\operatorname{val}(f) = \sum_{e \in \operatorname{out}(A)} f(e) - \sum_{e \in \operatorname{into}(A)} f(e)$$
$$= \sum_{e \in \operatorname{out}(A)} c(e)$$
$$= \operatorname{cap}(A, V \setminus A)$$

This finishes the proof.

Here the first equality uses the flow value lemma, and the second exploits the fact that the flow along incoming edges must be 0 as the residual graph does not have edges leaving A.

Analysis

Assumption:

All capacities are integers between 1 and C.

Analysis

Assumption:

All capacities are integers between 1 and C.

Invariant:

Every flow value f(e) and every residual capacity $c_f(e)$ remains integral troughout the algorithm.

Lemma 40

The algorithm terminates in at most $val(f^*) \le nC$ iterations, where f^* denotes the maximum flow. Each iteration can be implemented in time O(m). This gives a total running time of O(nmC).

Lemma 40

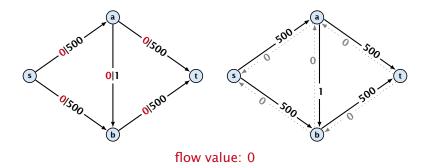

The algorithm terminates in at most $val(f^*) \le nC$ iterations, where f^* denotes the maximum flow. Each iteration can be implemented in time O(m). This gives a total running time of O(nmC).

Theorem 41

If all capacities are integers, then there exists a maximum flow for which every flow value f(e) is integral.

7.2 Shortest Augmenting Paths

15. Dec. 2022 310/320

Theorem 45

The shortest augmenting path algorithm performs at most $\mathcal{O}(mn)$ augmentations. Each augmentation can be performed in time $\mathcal{O}(m)$.

Theorem 45

The shortest augmenting path algorithm performs at most O(mn) augmentations. Each augmentation can be performed in time O(m).

Theorem 46 (without proof)

There exist networks with $m = \Theta(n^2)$ that require $\Omega(mn)$ augmentations, when we restrict ourselves to only augment along shortest augmenting paths.

Theorem 45

The shortest augmenting path algorithm performs at most O(mn) augmentations. Each augmentation can be performed in time O(m).

Theorem 46 (without proof)

There exist networks with $m = \Theta(n^2)$ that require $\Omega(mn)$ augmentations, when we restrict ourselves to only augment along shortest augmenting paths.

Note:

There always exists a set of m augmentations that gives a maximum flow (why?).

When sticking to shortest augmenting paths we cannot improve (asymptotically) on the number of augmentations.

When sticking to shortest augmenting paths we cannot improve (asymptotically) on the number of augmentations.

However, we can improve the running time to $\mathcal{O}(mn^2)$ by improving the running time for finding an augmenting path (currently we assume $\mathcal{O}(m)$ per augmentation for this).

We maintain a subset M of the edges of G_f with the guarantee that a shortest *s*-*t* path using only edges from M is a shortest augmenting path.

We maintain a subset M of the edges of G_f with the guarantee that a shortest *s*-*t* path using only edges from M is a shortest augmenting path.

With each augmentation some edges are deleted from M.

We maintain a subset M of the edges of G_f with the guarantee that a shortest *s*-*t* path using only edges from M is a shortest augmenting path.

With each augmentation some edges are deleted from M.

When M does not contain an s-t path anymore the distance between s and t strictly increases.

We maintain a subset M of the edges of G_f with the guarantee that a shortest *s*-*t* path using only edges from M is a shortest augmenting path.

With each augmentation some edges are deleted from M.

When M does not contain an s-t path anymore the distance between s and t strictly increases.

Note that M is not the set of edges of the level graph but a subset of level-graph edges.

M is initialized as the level graph L_G .

M is initialized as the level graph L_G .

Perform a DFS search to find a path from s to t using edges from M.

M is initialized as the level graph L_G .

Perform a DFS search to find a path from s to t using edges from M.

Either you find t after at most n steps, or you end at a node v that does not have any outgoing edges.

M is initialized as the level graph L_G .

Perform a DFS search to find a path from s to t using edges from M.

Either you find t after at most n steps, or you end at a node v that does not have any outgoing edges.

You can delete incoming edges of v from M.

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time $\mathcal{O}(m)$.

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time $\mathcal{O}(m)$.

The total cost for searching for augmenting paths during a phase is at most O(mn), since every search (successful (i.e., reaching t) or unsuccessful) decreases the number of edges in M and takes time O(n).

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time $\mathcal{O}(m)$.

The total cost for searching for augmenting paths during a phase is at most $\mathcal{O}(mn)$, since every search (successful (i.e., reaching t) or unsuccessful) decreases the number of edges in M and takes time $\mathcal{O}(n)$.

The total cost for performing an augmentation during a phase is only $\mathcal{O}(n)$. For every edge in the augmenting path one has to update the residual graph G_f and has to check whether the edge is still in M for the next search.

Let a phase of the algorithm be defined by the time between two augmentations during which the distance between s and t strictly increases.

Initializing *M* for the phase takes time $\mathcal{O}(m)$.

The total cost for searching for augmenting paths during a phase is at most $\mathcal{O}(mn)$, since every search (successful (i.e., reaching t) or unsuccessful) decreases the number of edges in M and takes time $\mathcal{O}(n)$.

The total cost for performing an augmentation during a phase is only $\mathcal{O}(n)$. For every edge in the augmenting path one has to update the residual graph G_f and has to check whether the edge is still in M for the next search.

There are at most *n* phases. Hence, total cost is $O(mn^2)$.

We need to find paths efficiently.

- We need to find paths efficiently.
- We want to guarantee a small number of iterations.

- We need to find paths efficiently.
- We want to guarantee a small number of iterations.

Several possibilities:

- We need to find paths efficiently.
- We want to guarantee a small number of iterations.

Several possibilities:

- Choose path with maximum bottleneck capacity.
- Choose path with sufficiently large bottleneck capacity.
- Choose the shortest augmenting path.

Intuition:

Choosing a path with the highest bottleneck increases the flow as much as possible in a single step.

Intuition:

- Choosing a path with the highest bottleneck increases the flow as much as possible in a single step.
- Don't worry about finding the exact bottleneck.

Intuition:

- Choosing a path with the highest bottleneck increases the flow as much as possible in a single step.
- Don't worry about finding the exact bottleneck.
- Maintain scaling parameter Δ .

- Choosing a path with the highest bottleneck increases the flow as much as possible in a single step.
- Don't worry about finding the exact bottleneck.
- Maintain scaling parameter Δ .
- $G_f(\Delta)$ is a sub-graph of the residual graph G_f that contains only edges with capacity at least Δ .

7.3 Capacity Scaling

15. Dec. 2022 316/320

Assumption:

All capacities are integers between 1 and C.

Assumption:

All capacities are integers between 1 and C.

Invariant:

All flows and capacities are/remain integral throughout the algorithm.

Assumption:

All capacities are integers between 1 and C.

Invariant:

All flows and capacities are/remain integral throughout the algorithm.

Correctness:

The algorithm computes a maxflow:

• because of integrality we have $G_f(1) = G_f$

Assumption:

All capacities are integers between 1 and C.

Invariant:

All flows and capacities are/remain integral throughout the algorithm.

Correctness:

The algorithm computes a maxflow:

- because of integrality we have $G_f(1) = G_f$
- therefore after the last phase there are no augmenting paths anymore

Assumption:

All capacities are integers between 1 and C.

Invariant:

All flows and capacities are/remain integral throughout the algorithm.

Correctness:

The algorithm computes a maxflow:

- because of integrality we have $G_f(1) = G_f$
- therefore after the last phase there are no augmenting paths anymore
- this means we have a maximum flow.

Lemma 47 *There are* $\lceil \log C \rceil + 1$ *iterations over* Δ *.* **Proof:** obvious.

Lemma 47 *There are* $\lceil \log C \rceil + 1$ *iterations over* \triangle *.* **Proof:** obvious.

Lemma 48

Let f be the flow at the end of a Δ -phase. Then the maximum flow is smaller than $val(f) + m\Delta$.

Proof: less obvious, but simple:

Lemma 47 *There are* $\lceil \log C \rceil + 1$ *iterations over* Δ *.* **Proof:** obvious.

Lemma 48

Let f be the flow at the end of a Δ -phase. Then the maximum flow is smaller than $val(f) + m\Delta$.

Proof: less obvious, but simple:

• There must exist an *s*-*t* cut in $G_f(\Delta)$ of zero capacity.

Lemma 47 *There are* $\lceil \log C \rceil + 1$ *iterations over* Δ . **Proof:** obvious.

Lemma 48

Let f be the flow at the end of a Δ -phase. Then the maximum flow is smaller than $val(f) + m\Delta$.

Proof: less obvious, but simple:

- There must exist an *s*-*t* cut in $G_f(\Delta)$ of zero capacity.
- ln G_f this cut can have capacity at most $m\Delta$.

Lemma 47 *There are* $\lceil \log C \rceil + 1$ *iterations over* Δ . **Proof:** obvious.

Lemma 48

Let f be the flow at the end of a Δ -phase. Then the maximum flow is smaller than $val(f) + m\Delta$.

Proof: less obvious, but simple:

- There must exist an *s*-*t* cut in $G_f(\Delta)$ of zero capacity.
- ln G_f this cut can have capacity at most $m\Delta$.
- This gives me an upper bound on the flow that I can still add.

Lemma 49

There are at most 2m augmentations per scaling-phase.

Lemma 49

There are at most 2m augmentations per scaling-phase.

Proof:

Let f be the flow at the end of the previous phase.

Lemma 49

There are at most 2m augmentations per scaling-phase.

Proof:

- Let f be the flow at the end of the previous phase.
- $\operatorname{val}(f^*) \leq \operatorname{val}(f) + 2m\Delta$

Lemma 49

There are at most 2m augmentations per scaling-phase.

Proof:

- Let f be the flow at the end of the previous phase.
- $\operatorname{val}(f^*) \leq \operatorname{val}(f) + 2m\Delta$
- Each augmentation increases flow by Δ .

Lemma 49

There are at most 2m augmentations per scaling-phase.

Proof:

- Let f be the flow at the end of the previous phase.
- $\operatorname{val}(f^*) \leq \operatorname{val}(f) + 2m\Delta$
- Each augmentation increases flow by Δ .

Theorem 50

We need $\mathcal{O}(m \log C)$ augmentations. The algorithm can be implemented in time $\mathcal{O}(m^2 \log C)$.
