#### **Properties of Binomial Trees**

▶  $B_k$  has  $2^k$  nodes.

- ▶  $B_k$  has  $2^k$  nodes.
- $\triangleright$   $B_k$  has height k.

- $\triangleright$   $B_k$  has  $2^k$  nodes.
- $\triangleright$   $B_k$  has height k.
- The root of  $B_k$  has degree k.

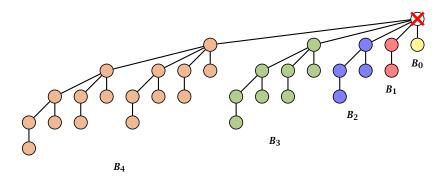

- ▶  $B_k$  has  $2^k$  nodes.
- $\triangleright$   $B_k$  has height k.
- The root of  $B_k$  has degree k.
- $B_k$  has  $\binom{k}{\ell}$  nodes on level  $\ell$ .

- $\triangleright$   $B_k$  has  $2^k$  nodes.
- $\triangleright$   $B_k$  has height k.
- The root of  $B_k$  has degree k.
- $B_k$  has  $\binom{k}{\ell}$  nodes on level  $\ell$ .
- Deleting the root of  $B_k$  gives trees  $B_0, B_1, \ldots, B_{k-1}$ .

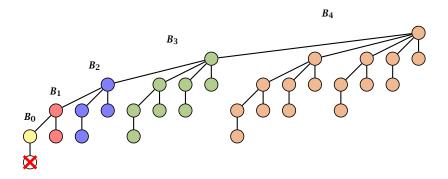

Deleting the root of  $B_5$  leaves sub-trees  $B_4$ ,  $B_3$ ,  $B_2$ ,  $B_1$ , and  $B_0$ .

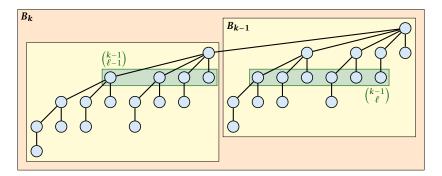

19. Dec. 2022 116/132

Deleting the leaf furthest from the root (in  $B_5$ ) leaves a path that connects the roots of sub-trees  $B_4$ ,  $B_3$ ,  $B_2$ ,  $B_1$ , and  $B_0$ .

19. Dec. 2022 117/132

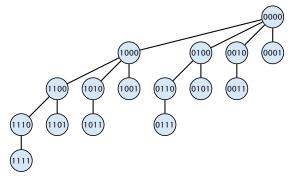

The number of nodes on level  $\ell$  in tree  $B_k$  is therefore

$$\binom{k-1}{\ell-1} + \binom{k-1}{\ell} = \binom{k}{\ell}$$

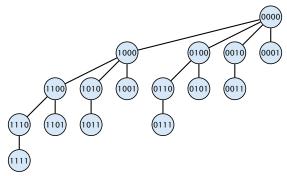

6.2 Binomial Heaps

19. Dec. 2022 118/132

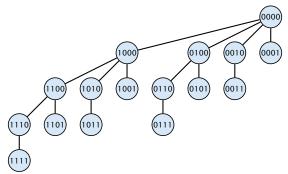

19. Dec. 2022 119/132

The binomial tree  $B_k$  is a sub-graph of the hypercube  $H_k$ .

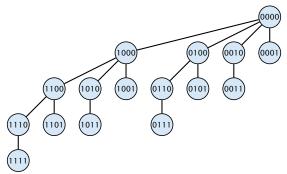

19. Dec. 2022 119/132

The binomial tree  $B_k$  is a sub-graph of the hypercube  $H_k$ .

The parent of a node with label  $b_k, \ldots, b_1$  is obtained by setting the least significant 1-bit to 0.

The binomial tree  $B_k$  is a sub-graph of the hypercube  $H_k$ .

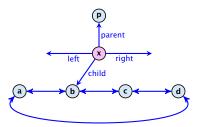

The parent of a node with label  $b_k, \ldots, b_1$  is obtained by setting the least significant 1-bit to 0.

The  $\ell$ -th level contains nodes that have  $\ell$  1's in their label.

#### How do we implement trees with non-constant degree?

The children of a node are arranged in a circular linked list.

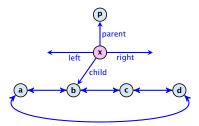

6.2 Binomial Heaps

#### How do we implement trees with non-constant degree?

- The children of a node are arranged in a circular linked list.
- A child-pointer points to an arbitrary node within the list.

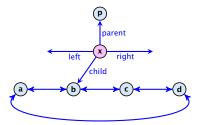

6.2 Binomial Heaps

#### How do we implement trees with non-constant degree?

- The children of a node are arranged in a circular linked list.
- A child-pointer points to an arbitrary node within the list.
- A parent-pointer points to the parent node.

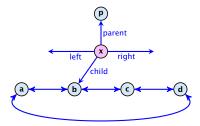

6.2 Binomial Heaps

#### How do we implement trees with non-constant degree?

- The children of a node are arranged in a circular linked list.
- A child-pointer points to an arbitrary node within the list.
- A parent-pointer points to the parent node.
- Pointers x.left and x.right point to the left and right sibling of x (if x does not have siblings then x.left = x.right = x).

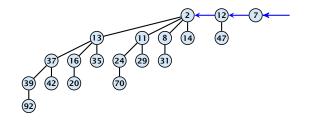

6.2 Binomial Heaps

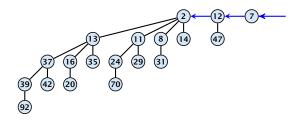

- Given a pointer to a node x we can splice out the sub-tree rooted at x in constant time.
- We can add a child-tree T to a node x in constant time if we are given a pointer to x and a pointer to the root of T.

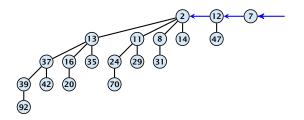

6.2 Binomial Heaps

In a binomial heap the keys are arranged in a collection of binomial trees.

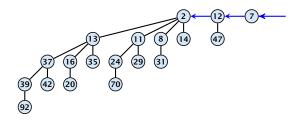

In a binomial heap the keys are arranged in a collection of binomial trees.

Every tree fulfills the heap-property

In a binomial heap the keys are arranged in a collection of binomial trees.

Every tree fulfills the heap-property

There is at most one tree for every dimension/order. For example the above heap contains trees  $B_0$ ,  $B_1$ , and  $B_4$ .

Given the number n of keys to be stored in a binomial heap we can deduce the binomial trees that will be contained in the collection.

Given the number n of keys to be stored in a binomial heap we can deduce the binomial trees that will be contained in the collection.

Let  $B_{k_1}$ ,  $B_{k_2}$ ,  $B_{k_3}$ ,  $k_i < k_{i+1}$  denote the binomial trees in the collection and recall that every tree may be contained at most once.

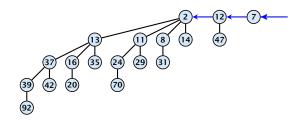

Given the number n of keys to be stored in a binomial heap we can deduce the binomial trees that will be contained in the collection.

Let  $B_{k_1}$ ,  $B_{k_2}$ ,  $B_{k_3}$ ,  $k_i < k_{i+1}$  denote the binomial trees in the collection and recall that every tree may be contained at most once.

Then  $n = \sum_i 2^{k_i}$  must hold. But since the  $k_i$  are all distinct this means that the  $k_i$  define the non-zero bit-positions in the binary representation of n.

Properties of a heap with *n* keys:

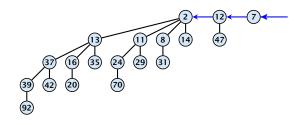

6.2 Binomial Heaps

#### Properties of a heap with *n* keys:

Let  $n = b_d b_{d-1}, \dots, b_0$  denote binary representation of n.

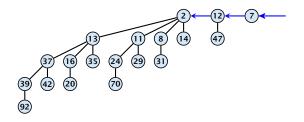

6.2 Binomial Heaps

#### Properties of a heap with *n* keys:

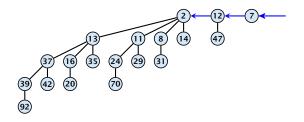

- Let  $n = b_d b_{d-1}, \dots, b_0$  denote binary representation of n.
- The heap contains tree  $B_i$  iff  $b_i = 1$ .

#### Properties of a heap with *n* keys:

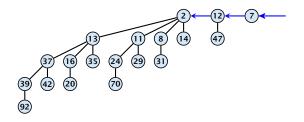

- Let  $n = b_d b_{d-1}, \dots, b_0$  denote binary representation of n.
- The heap contains tree  $B_i$  iff  $b_i = 1$ .
- Hence, at most  $\lfloor \log n \rfloor + 1$  trees.

#### Properties of a heap with *n* keys:

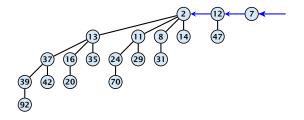

- Let  $n = b_d b_{d-1}, \dots, b_0$  denote binary representation of n.
- The heap contains tree  $B_i$  iff  $b_i = 1$ .
- Hence, at most  $\lfloor \log n \rfloor + 1$  trees.
- The minimum must be contained in one of the roots.

#### Properties of a heap with *n* keys:

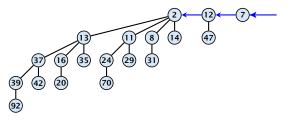

- Let  $n = b_d b_{d-1}, \dots, b_0$  denote binary representation of n.
- The heap contains tree  $B_i$  iff  $b_i = 1$ .
- Hence, at most  $\lfloor \log n \rfloor + 1$  trees.
- The minimum must be contained in one of the roots.
- The height of the largest tree is at most  $\lfloor \log n \rfloor$ .

#### Properties of a heap with *n* keys:

- Let  $n = b_d b_{d-1}, \dots, b_0$  denote binary representation of n.
- The heap contains tree  $B_i$  iff  $b_i = 1$ .
- Hence, at most  $\lfloor \log n \rfloor + 1$  trees.
- The minimum must be contained in one of the roots.
- The height of the largest tree is at most  $\lfloor \log n \rfloor$ .
- The trees are stored in a single-linked list; ordered by dimension/size.

The merge-operation is instrumental for binomial heaps.

The merge-operation is instrumental for binomial heaps.

A merge is easy if we have two heaps with different binomial trees. We can simply merge the tree-lists.

### **Binomial Heap: Merge**

The merge-operation is instrumental for binomial heaps.

A merge is easy if we have two heaps with different binomial trees. We can simply merge the tree-lists.

Otherwise, we cannot do this because the merged heap is not allowed to contain two trees of the same order.

### **Binomial Heap: Merge**

The merge-operation is instrumental for binomial heaps.

A merge is easy if we have two heaps with different binomial trees. We can simply merge the tree-lists.

Otherwise, we cannot do this because the merged heap is not allowed to contain two trees of the same order.

Merging two trees of the same size: Add the tree with larger root-value as a child to the other tree.

### **Binomial Heap: Merge**

The merge-operation is instrumental for binomial heaps.

A merge is easy if we have two heaps with different binomial trees. We can simply merge the tree-lists.

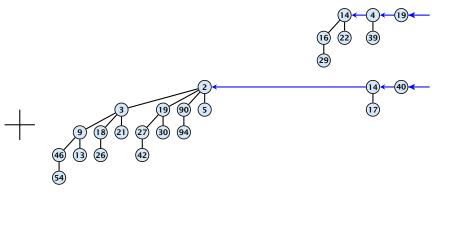

Otherwise, we cannot do this because the merged heap is not allowed to contain two trees of the same order.

Merging two trees of the same size: Add the tree with larger root-value as a child to the other tree.

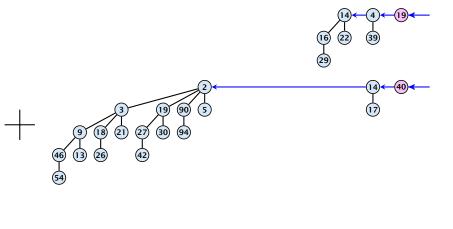

For more trees the technique is analogous to binary addition.

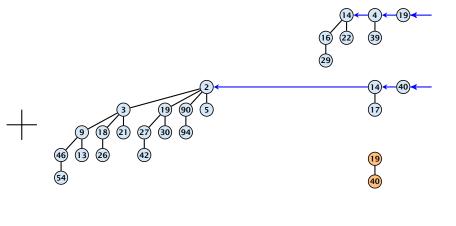

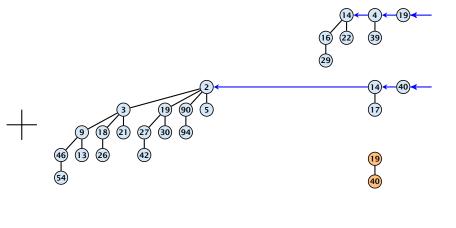

----

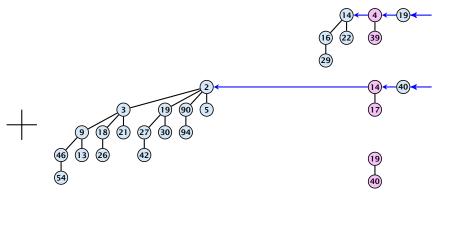

----

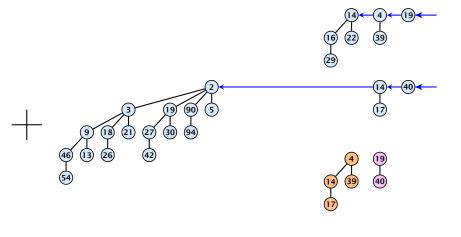

----

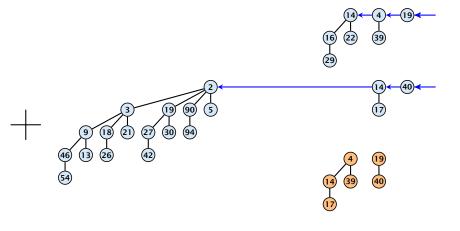

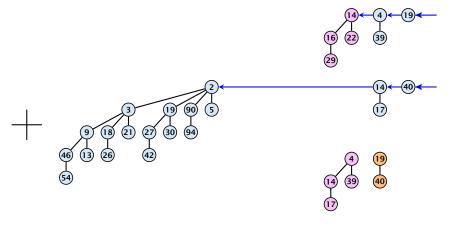

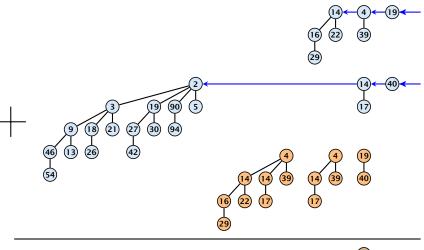

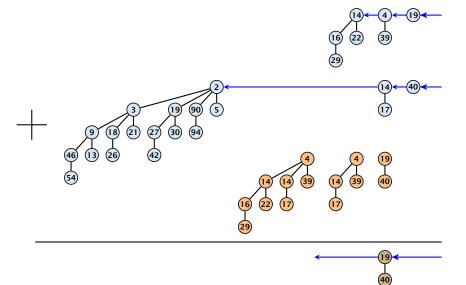

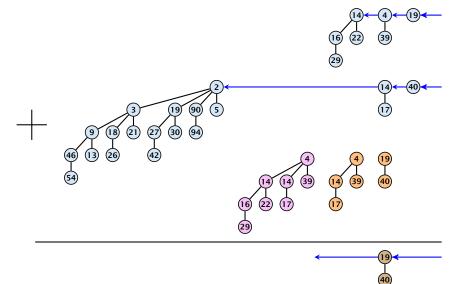

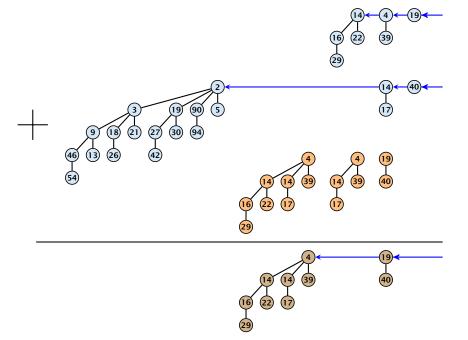

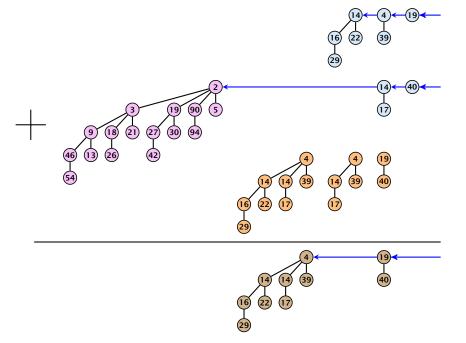

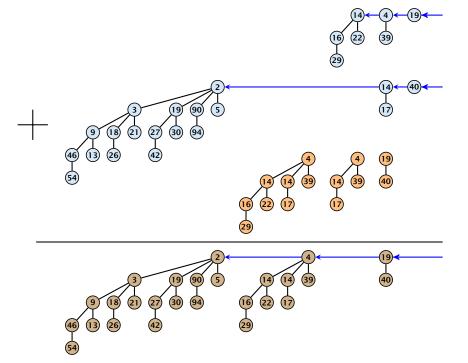

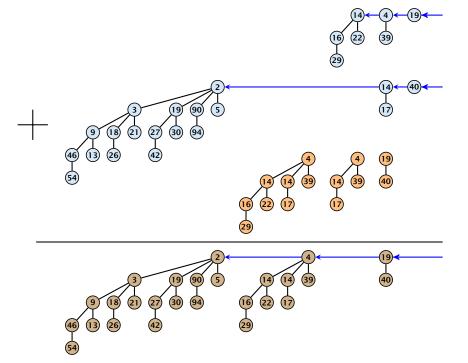

- $S_1$ . merge( $S_2$ ):
  - Analogous to binary addition.

- $S_1$ . merge( $S_2$ ):
  - Analogous to binary addition.
  - Time is proportional to the number of trees in both heaps.

- *S*<sub>1</sub>. merge(*S*<sub>2</sub>):
  - Analogous to binary addition.
  - Time is proportional to the number of trees in both heaps.
  - Time:  $\mathcal{O}(\log n)$ .

#### All other operations can be reduced to merge().

S. insert(x):

Create a new heap S' that contains just the element x.

#### All other operations can be reduced to merge().

S. insert(x):

- Create a new heap S' that contains just the element x.
- Execute S. merge(S').

#### All other operations can be reduced to merge().

### S. insert(x):

- Create a new heap S' that contains just the element x.
- Execute S. merge(S').
- Time:  $\mathcal{O}(\log n)$ .

### S. minimum():

- Find the minimum key-value among all roots.
- Time:  $\mathcal{O}(\log n)$ .

### S. delete-min():

Find the minimum key-value among all roots.

- Find the minimum key-value among all roots.
- Remove the corresponding tree  $T_{\min}$  from the heap.

- Find the minimum key-value among all roots.
- Remove the corresponding tree  $T_{\min}$  from the heap.
- Create a new heap S' that contains the trees obtained from  $T_{\min}$  after deleting the root (note that these are just  $\mathcal{O}(\log n)$  trees).

- Find the minimum key-value among all roots.
- Remove the corresponding tree  $T_{\min}$  from the heap.
- ► Create a new heap S' that contains the trees obtained from T<sub>min</sub> after deleting the root (note that these are just O(log n) trees).
- ► Compute *S*.merge(*S*′).

- Find the minimum key-value among all roots.
- Remove the corresponding tree  $T_{\min}$  from the heap.
- ► Create a new heap S' that contains the trees obtained from T<sub>min</sub> after deleting the root (note that these are just O(log n) trees).
- ► Compute *S*.merge(*S*′).
- Time:  $\mathcal{O}(\log n)$ .

*S*. decrease-key(handle *h*):

- *S*. decrease-key(handle *h*):
  - Decrease the key of the element pointed to by h.

- S. decrease-key(handle h):
  - Decrease the key of the element pointed to by h.
  - Bubble the element up in the tree until the heap property is fulfilled.

- S. decrease-key(handle h):
  - Decrease the key of the element pointed to by h.
  - Bubble the element up in the tree until the heap property is fulfilled.
  - Time:  $O(\log n)$  since the trees have height  $O(\log n)$ .

S. delete(handle h):

6.2 Binomial Heaps

19. Dec. 2022 132/132

- S. delete(handle h):
  - Execute *S*. decrease-key( $h, -\infty$ ).
