5.2 Red Black Trees

Definition 3

A red black tree is a balanced binary search tree in which each internal node has two children. Each internal node has a color, such that

- 1. The root is black.
- 2. All leaf nodes are black.
- 3. For each node, all paths to descendant leaves contain the same number of black nodes.
- 4. If a node is red then both its children are black.

The null-pointers in a binary search tree are replaced by pointers to special null-vertices, that do not carry any object-data

5.2 Red Black Trees

Lemma 4

A red-black tree with n internal nodes has height at most $O(\log n)$.

Definition 5

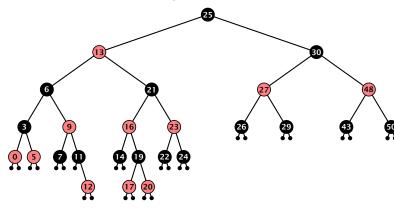

The black height $\mathrm{bh}(v)$ of a node v in a red black tree is the number of black nodes on a path from v to a leaf vertex (not counting v).

We first show:

Lemma 6

A sub-tree of black height $\mathrm{bh}(v)$ in a red black tree contains at least $2^{\mathrm{bh}(v)}-1$ internal vertices.

Red Black Trees: Example

5.2 Red Black Trees

Proof of Lemma 6.

Induction on the height of v.

base case (height(v) = 0)

- ▶ If height(v) (maximum distance btw. v and a node in the sub-tree rooted at v) is 0 then v is a leaf.
- ightharpoonup The black height of v is 0.
- ► The sub-tree rooted at v contains $0 = 2^{\text{bh}(v)} 1$ inner vertices.

5.2 Red Black Trees

Proof (cont.)

induction step

- ▶ Supose v is a node with height(v) > 0.
- v has two children with strictly smaller height.
- These children (c_1, c_2) either have $bh(c_i) = bh(v)$ or $bh(c_i) = bh(v) 1$.
- **By** induction hypothesis both sub-trees contain at least $2^{\text{bh}(v)-1}-1$ internal vertices.
- ► Then T_v contains at least $2(2^{\mathrm{bh}(v)-1}-1)+1 \ge 2^{\mathrm{bh}(v)}-1$ vertices.

5.2 Red Black Trees

Definition 1

A red black tree is a balanced binary search tree in which each internal node has two children. Each internal node has a color, such that

- 1. The root is black.
- 2. All leaf nodes are black.
- **3.** For each node, all paths to descendant leaves contain the same number of black nodes.
- 4. If a node is red then both its children are black.

The null-pointers in a binary search tree are replaced by pointers to special null-vertices, that do not carry any object-data.

5.2 Red Black Trees

Proof of Lemma 4.

Let h denote the height of the red-black tree, and let P denote a path from the root to the furthest leaf.

At least half of the node on *P* must be black, since a red node must be followed by a black node.

Hence, the black height of the root is at least h/2.

The tree contains at least $2^{h/2} - 1$ internal vertices. Hence, $2^{h/2} - 1 \le n$.

Hence,
$$h \le 2\log(n+1) = \mathcal{O}(\log n)$$
.

5.2 Red Black Trees

We need to adapt the insert and delete operations so that the red black properties are maintained.

Rotations

The properties will be maintained through rotations:

Harald Räcke

59/75

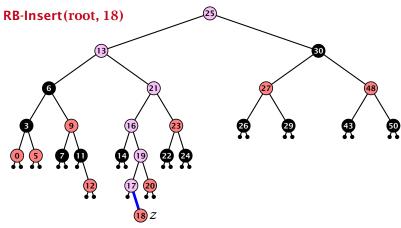

Red Black Trees: Insert

Invariant of the fix-up algorithm:

- **z** is a red node
- the black-height property is fulfilled at every node
- the only violation of red-black properties occurs at z and parent[z]
 - either both of them are red (most important case)
 - or the parent does not exist (violation since root must be black)

If z has a parent but no grand-parent we could simply color the parent/root black; however this case never happens.

Red Black Trees: Insert

Insert:

- first make a normal insert into a binary search tree
- then fix red-black properties

Algorithm 6 InsertFix(z)

13: $col(root[T]) \leftarrow black;$

Harald Räcke

es: Insert Red Black Trees: Insert

```
1: while parent[z] \neq null and col[parent[z]] = red do
        if parent[z] = left[gp[z]] then z in left subtree of grandparent
             uncle \leftarrow right[grandparent[z]]
3:
             if col[uncle] = red then
4:
                                                            Case 1: uncle red
                 col[p[z]] \leftarrow black; col[u] \leftarrow black;
5:
                 col[gp[z]] \leftarrow red; z \leftarrow grandparent[z];
6:
7:
             else
                                                          Case 2: uncle black
                 if z = right[parent[z]] then
8:
                                                             2a: z right child
                      z \leftarrow p[z]; LeftRotate(z);
9:
                 col[p[z]] \leftarrow black; col[gp[z]] \leftarrow red; 2b: z left child
10:
                  RightRotate(gp[z]);
11:
        else same as then-clause but right and left exchanged
```

Red Black Trees: Insert

Running time:

- Only Case 1 may repeat; but only h/2 many steps, where h is the height of the tree.
- ► Case 2a → Case 2b → red-black tree
- ► Case 2b → red-black tree

Performing Case 1 at most $\mathcal{O}(\log n)$ times and every other case at most once, we get a red-black tree. Hence $\mathcal{O}(\log n)$ re-colorings and at most 2 rotations.

Red Black Trees: Delete

First do a standard delete.

If the spliced out node x was red everything is fine.

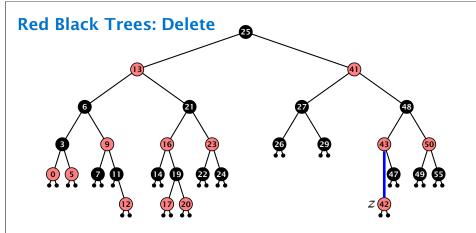

If it was black there may be the following problems.

- \triangleright Parent and child of x were red; two adjacent red vertices.
- If you delete the root, the root may now be red.
- Every path from an ancestor of x to a descendant leaf of x changes the number of black nodes. Black height property might be violated.

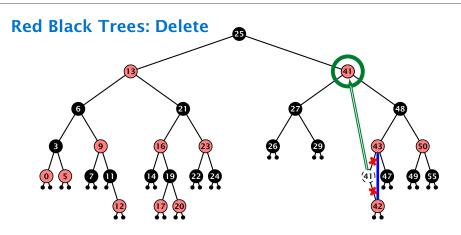

5.2 Red Black Trees

15. Dec. 2022 67/75

Delete:

- deleting black node messes up black-height property
- if z is red, we can simply color it black and everything is fine
- ► the problem is if *z* is black (e.g. a dummy-leaf); we call a fix-up procedure to fix the problem.

Case 3:

Element has two children

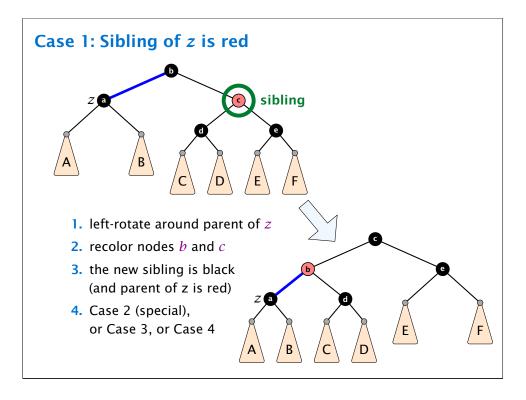

- do normal delete
- when replacing content by content of successor, don't change color of node

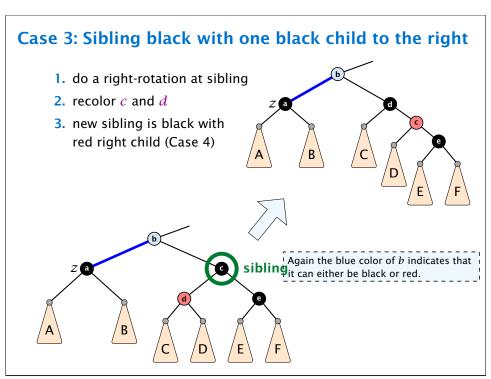

Red Black Trees: Delete

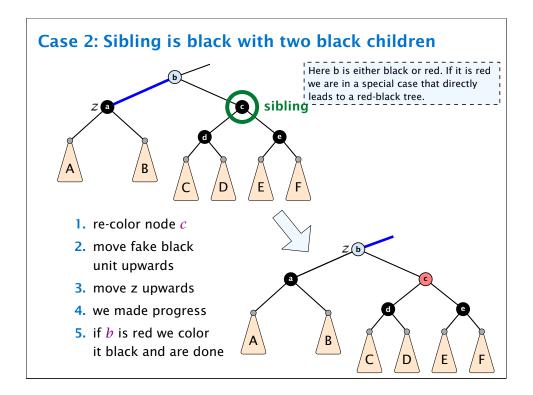

Invariant of the fix-up algorithm

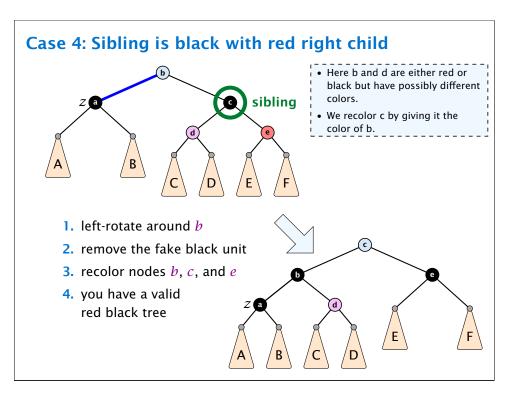

- ► the node *z* is black
- ▶ if we "assign" a fake black unit to the edge from z to its parent then the black-height property is fulfilled

Goal: make rotations in such a way that you at some point can remove the fake black unit from the edge.

Running time:

- only Case 2 can repeat; but only h many steps, where h is the height of the tree
- Case 1 → Case 2 (special) → red black tree
 - Case 1 \rightarrow Case 3 \rightarrow Case 4 \rightarrow red black tree
 - Case 1 → Case 4 → red black tree
- ► Case 3 → Case 4 → red black tree
- ► Case 4 → red black tree

Performing Case 2 at most $\mathcal{O}(\log n)$ times and every other step at most once, we get a red black tree. Hence, $\mathcal{O}(\log n)$ re-colorings and at most 3 rotations.
